QST has had at least two such pieces in the recent past. I remember one of them especially well because it voiced a gripe I also have about the fact that a lot of people don't keep their address current with FCC and so it is getting hard to send QSLs to Callbook QTH - let alone get returns. Another dealt with the deadly effect that EMC/RFI will likely have on ham radio as we all crowd into subdivisions with close neighbors and lots of very susceptable devices - no wonder we have all those restrictive covenants.

I think that these are a very good feature of QST and hope that there will be many more such articles.

Perhaps, although I can't be certain, Fred was trying to make a
point that he really could care less about Joe-Bob-Henry-Jake "Mr.
QRP" Smith dropping dead at his station at 99.5 years of age :-).

I've seen this "let's list the dead" stuff before in other hobbies,
and I've always wondered about it. Surely these people who are
dropping off weren't REALLY the saints their "silent key"/"broken
wand", etc., listings make them out to be?

> My Fred, you sure have an attitude...

Perhaps so, but I think he has a point in this case at least.

Monitoring Times and Popular Communications both have significantly
more technical information in any one issue than QST does, and
yet QST is almost double the thickness, and involves transmitting
as well as recieving. To get snide for a moment, it seems to me
that while QST is printing articles on how to build a QRP transmitter
from some tin cans, baling wire, and catgut, PopComm is printing
articles about different ways to use a Frequency Counter, or
reviewing new and compact antennas. Even Nuts & Volts has better
articles than QST, and it's basically a newspaper.

I get audible hum from a WE 2500 handset at 13" from the front of
the screen, and 18" from the right side of the unit. This is with the
handset not connected to a telephone, and with an Apple 13" monitor.
There's definitely a nice strong field there.

If there's sufficient interest, I can get an AC gaussmeter
and make detailed measurements.

Wullenwebers are sometimes used with RF amps on each antenna,
so that multiple receivers can be connected, each with its own
phasing network. This gives the effect of an arbitrarily large number
of big directional antennas. There's an economy of scale here if you
have enough receivers.

```
* As for mounting it: definitely go for a punch (such as Greenlee) if at all
* possible. Buying one is a LOT more expensive than your antenna, though!
* I managed to borrow one, which was wonderful. Failing that, unless the
* hole is quite small, go for a hole saw. Drills produce 3-sided holes when
* drilling in sheet metal.

Use a drill a couple sizes smaller than the finished hole. Then get a
countersink the size of the hole you want and use that to "drill" out
the hole to the correct size. It is a little bit slower but will give
a very round hole in sheetmetal.

^^^^^
G5RV's are not susposed to need baluns and mine doen't have one and works fine. I have heard of one guy who took the balun off and found that his G5RV worked much better. I also do a lot of DXing and always seem to do fairly well in pileups. My G5RV is 20 feet off the ground in the middle and the feedline is parallel to the ground also. It tunes up with no problems on 20 and 40 meters. Can't help but wonder if the balun is screwing things up or if the G5RV isn't cut to the right length. The G5RV is susposed to shine on 20 meters which is what it really was designed for. How are the finals in your friends transmitter? That could be what the problem is.
A full length G5RV is 102 feet and the matching section is 34 feet. The small version is 51 feet and the matching section is 17 feet (mine). A full size G5RV has a lower angle of radiation on 20 meters then a 1/2 wave 20 meter dipole. So all things being equal he should be cracking the pileups and not you. Could be a combination of weak finals and poor pileup technique. Also are your antenna's oriented the same directions? I have found that my G5RV is somewhat direction and doesn't pick up well off the ends. So I hear Europe fine and hardly hear Australia who is just across the pond from me. Good luck and I hope that I helped in some way! 73!

2259. 1993 Rat Shack catty released

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-14 18:59:46 UTC
From: julian@bongo.UUCP
Message-ID: <581@bongo.UUCP>
Source record: 285689

For all the tinkerers, hackers and homebrewers, the 1993 Radio Shack catalogue is now available at your local Rat Shack.

It has about 20 less pages than the 1992 edition. But they have changed the layout.

Radio shack sells components, radios - even a 2M walkie-talkie, antennas, coax and microphones.

There are books on amateur radio. Even tapes to help you learn Morris. There is even a walkie-talkie (49 Mhz) with a Morris button and a print out of the code on the case. These are called "Space Patrol" walkie-talkies.

Dentron manufactured the Clipperton-L linear about 10 years ago. My amp has a power supply problem with one or more open capacitors in the voltage doubler circuit. I need information on whether Dentron or someone else has capacitors available. Appararent
l
y Dentron is out of business (no telephone) and the Sprague capacitors are proprietary so no one stocks the 100uF, 500V electrolytic capacitors. HELP!

BOB AC4MI (not a Tibet callletter)

2261. Rat Shack VHF walkie-talkies

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-14 19:07:25 UTC
From: julian@bongo.UUCP
Message-ID: <582@bongo.UUCP>
Source record: 285690

Browsing through my Rat Shack catty, I was looking at the "Handheld 2-Meter Synthesized VHF-FM Transceiver". Costs $260.00. Then on the next page is "New! Handheld VHF-FM Business Transceiver" $150.00

So for those amateurs in rural areas where there is only the local machine, this xtal controlled unit looks like a good deal. The blurb says it comes with one xtal for 151.625 Mhz and has 1 watt output. It is a 2 channel unit.

So, anyone know how easy it would be to put one of these on 2 Meters? I would guess it should require just an xtal change and a retune.

De mortuis nil nisi bonum.

I think that it makes more sense in this hobby in which one is much more likely to meet hundreds of new people on the air every month. You may even have a regular sked with some one whom you never meet except on the air. Wouldn't you like to know? A call sign listed in the Silent Keys list may evoke a memory of some nice qso that you might have had. CW ofcourse. :)

Besides, it is, generally, only half a page or so.

There could also other side benefits. Such as a previously reported study of biological effects of RF that used the Silent Key list to determine if RF exposure led to increased incidences of cancer. You can read about that and the report of a blue ribbon committee put together by, yes - none other than, ARRL. And it was discussed in an editorial in, yes - believe or not, QST. :)

After reading so many negative notes about the QST journal, may be I should write a note about the joys of reading QST, new and old. But then, it would be a really biased view as I am very pleased to have a complete collection going back to 1947. It is interesting to read old correspondence. You will be amazed with how current the issues discussed in them are. Bad operators and discourteous DX hounds were as much a problem then as they are today.

2263. Detachable Head Radios (Summary)

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-14 19:43:04 UTC
From: dlp@zule.Eng.Sun.COM
Message-ID: <l8o368INNh78@appserv.Eng.Sun.COM>
Source record: 285751

Okay, first off I will ignore the respondent that thought I was referring
to radios that required the operator to remove their head.:-)

Overwhelmingly, the radio of choice among those that responded was the
Kenwood pair, the 741 and 732. Alinco came in second with one vote for
the ICOM 901, and no responses for the Yaesu. This of course is a highly
unscientific poll, but then so are most polls done by the media.:-)
It is interesting to note however that Kenwood wasn't originally on
my list, but won the tally as a write in. Seems to be a good year for
write in candidates, now lets hope Kenwood doesn't pull the model before
I get to buy it.:-) (Note this was a joke and in no way is intended to
state support for any presidental candidates and certainly is not intended
to start a thread on the viability of the candidates.:-))

I also receive a couple of responses about using the radio in an Acura,
both of them being positive. A trip to HRO also boosted my confidence
that if I keep the main unit in the trunk and keep the RF back there
as well that I should have no problems. It is mainly when you run
the coax within a few inches of the engine control unit that you
introduce the possibility of trouble.

Thanks to all that responded.

> ---G6WBJ--- Peter J.M. Lucas pjml%swmis.nsw.ac.uk@nsfnet-relay.ac.uk
> Conserve water - swim in the shallow end
> of the pool.

I have heard this before, and I still fail to see what harm cw abbreviations or q-codes do the phone bands. I wonder if Peter never, ever says q-codes on phone like "Gee, John, great QSO" or "Sorry, Phil, the QRM took that, try again". The usage of OM, QSO, QRM, QSY, etc seems well established on phone.

Comments, anyone?

2269. Huge Antenna at Augsburg

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-14 20:16:47 UTC
From: cookav@catipult.anatcp.rockwell.COM
Message-ID: <9208142017.AA0fc7@catipult.anatcp.rockwell.com>
Source record: 285749

Greetings...
Nick, KD4CPL wrote about seeing a huge, round antenna in the area near Augsburg, wondering what it was.

That antenna is an AN/FLR-9 receiving antenna, used for WORLDWIDE monitoring and direction finding. I worked there in the mid '70s, when the Army Security Agency had the facility. The ASA no longer exists, and I don't know who owns the facility now.

What did I do there? Worked on model 28 Teletypes...

73,
Alan, N7CEU

>>defective unit, or if it is a design problem. I measured the IMD dynamic

Did you mean factory NEW when you said "new" or just new to you?
There is a free factory upgrade for the FT-470 that applies to models from
certain lot numbers. I believe the most predominant one is lot #19 and
lower have terrible intermod problems. Mods are made (supposedly) to IF
stages etc... and sensitivity as well as selectivity are increased after
the mod. There may be other lots that have problems as well (I know lot
#30 has quite a number of problems ie. batt saver not functioning
correctly, low output power, mushy squelch etc...). The lot number is
usually the first two digits of the serial number if I remember correctly.

I would suggest calling Yaesu at (800)255-9237. They will probably
be most helpful and will tell you if there are any upgrade mods since you
bought your radio.

Well, As long as this thread is still open... I have in front of me
a Nec MultiSync 4FG monitor and an IBM 3472 monitor, not more than one
foot between them, and guess where my Panasonic phone resides? Right in
between them. The NEC is quite new, replacing an Apple 13 inch. Oh,
BTW, I often use my Mac IIcx to dial my phone for me by holding the
hand set right up to the Mac speaker and clicking a "dial number" button
with the mouse.
However, to listen to BBC broadcast (17.86 Mhz) I had to move my
little Sony receiver at least 4 feet away! ;-)

>may be of help to you.

WHY DOES EVERYONE keep saying "my G5RV does not have a balun" ???????

He bought this G5RV and it came with a balun -- connected between the
300 ohm twin lead and the coax.

Are there different "flavors" of G5RV antennas?

... and I kept telling him "put up a dipole" :-)

> Most of the other large national radio organizations (RSGB,
> DARC, etc.) have newsletters as well. So what's the problem?

Well Alan, I didn't say there was a problem with QST being a newsletter.
I was only characterizing the magazine as a whole. The 'newsletter'
label is but one of the things which differentiates it from, say, _CQ_.

> How many
> other ham radio magaizines in the U.S. have shown the same
> reliability and stability? How many pages did you find with
> contest scores last month? The month before? How many pages
> did you find announcing upcoming contests? How many pages was

> areas of interest in ham radio, there has to be some balance.

Well, I haven't counted the pages, but I did count six questions
right there :-) Yes, having a balance is a _good_thing_. The
relative proportions which make up that balance are subject to debate,
as the ARRL has indicated themselves by having solicited opinions
here on the net.

>>QST is the ARRL. Technically, I'm a member of the ARRL, but in reality
>>...Stuff deleted...
>
> QST is not the ARRL - we the members are the ARRL. QST _is_ the
> journal of the ARRL. I have been a life member for 25 years.

Ok. How many members would the ARRL have if it did not publish QST?
QST is the heart and soul of the ARRL. I always thought it was a
bit corny to receive an 8 1/2 by 11 envelope after I subscribed which
contained a framable certificate stating that I had been "elected"
as a member of the ARRL. I guess I was elected by a 54 (dollars) to
0 margin, since nobody paid me _not_ to subscribe. Since you're a
life member, I guess that your election campaign was better financed
than mine :-)

> Do not expect all of the membership to share your point
> of view, however.

I don't expect if from them any more than I expect it from this net. As my article stated, I'm stating an opinion here, in a public forum. I did not suggest nor do I care if my views are shared by all. I am pleased, however, that some people found my article to be interesting reading. I'm also pleased that I was able to inject some controversy into an otherwise moribund subject, something incidentally, that QST rarely does (court controversy).

>> Re: David Sumner, K1ZZ
>
> Dave is more active on the air than you might think. He has been
> an active contest operator for years, and back in the 60's his
> . . .

My retoric about Dave (whom I don't feel strongly pro _or_ con about), stem from the fact that most of us _don't_ know who he is, _don't_ know where he came from, and have no visual image of him other than the stuffed suit pictures that we see in QST from time to time. Yes, I suppose we should trust that our representative leadership elected the right guy, I just wish that we could see a mini-biography of these league folk once in a while. A down-home picture of him sitting in his own shack would go a long way here - see the cover of any copy of CQ for an example. Dave, if you're reading this I want you to know that I think you're probably a great guy, but it's kind of hard to tell what kind of person you are solely from the exposure you get in QST.

>>
>>Next comes the OPERATING section. "Operating" is an ARRL codeword which

> maker for the ARRL, CQ or any other sponsor of a major or minor
> operating event. It takes lots of folks to run a radio contest.

BZZZZZZZZT!!! Nice try, and thanks for playing! :-)

You've probably guessed by now that I'm not a big contest fan. I've got nothing against it, it just doesn't appeal to me. I believe, however, that I am in the minority with this position and that there are a significant number of contesters out there that buy lots and lots of radio gear. The sales of this equipment is one of the things which drives advertising, which gives the ARRL its lifeblood. In promoting contests in the way they do, they further the hobby of contesting which in turn fuels the success of QST and in turn, the league. The ARRL could not make it without contesting.

>>Next comes the DEPARTMENTS. In general, a "department" is defined as
>>any special interest or politically correct topic which takes less than a
>
>>...more sniveling deleted...

Ouch! (Well, I guess its only fair that I take some articulate
critisizm too :-)

>> Re: voting and League Membership
>
> This is quite similar to our democratic process. Not everyone votes
> either, so it is the majority of those who make their wishes known
> that has a chance to control these situations. If the Officers
> choose to ignore the majority, eventually they are chastised and
> turned out of office. What's the problem?

The problem is that the _real_ majority is not heard. What we end
up with is management by whining, followed by the utter astonishment
of the majority at large who weren't polled or didn't proactively
make their opinion known. My suggestion is to proactively solicit
votes, to make it rediculously easy. No matter how hard you try,
you can't extrapolate from a 1% sample consisting only of the _most_
motivated constituients. Samples have to be random before
extrapolation can become accurate.

>>I've never met a section manager or district chief, and don't even know
>>who my local representatives are. In todays age of instant
>
> Why don't you get acquainted - they really are not such bad people.

I didn't say they were. Our local section manager is in Tucson,
100 miles south of here. Perhaps I should call him to say that I
have a few suggestions regarding the role and content of QST. On the
other hand, I think my opinions would better heard in a larger forum
(such as this network) and possibly have a greater overall ultimate
effect. After all, my local SM is likely to forget what I said come
convention time, but at least I know that there would have been a
chance that the ARRL would have seen my opinions here. In fact, I'd
say that the chances were quite high that they're reading this right
now, but won't dare risk exposing themselves to engaging in a frank,
over-the-net discussion on any topic.

Yeah, that's the ticket, write them a letter and/or discuss it with
your local Section Manager.....

```
;From: flloyd@L1-A.West.Sun.COM (Fred Lloyd [Phoenix SE])
;Newsgroups: rec.radio.amateur.misc
;Subject: QST, in my opinion...
;Date: 13 Aug 92 20:47:59 GMT
;Organization: Sun Microsystems, Phoenix, AZ
;Lines: 177
;
;QST is first and foremost, a club newsletter. Second, it's a
;revenue source and third, it's a technical contest journal.
;Let's examine these points.
;
<DELETIONS>
;
;On the very first few pages, just past the initial advertisements
;(which cost upwards of $1200 per page), the magazine begins. First up,
;(on page 3), the Table of Contents. Then, a few ad pages later, the
;first club item: a listing of club directors and section managers,
;their territories, names, addresses and telephone numbers. Immediately
;following is the opening editorial, which as of late has become the
;David Sumner, K1ZZ pontification page. Dave must be one heck of a ham
;however, I get the feeling that you'd be more likely making a space
;shuttle contact than actually hearing him on the air. Have you ever
;noticed how many 1-landers have been League executives? Somehow I
;don't get the impression that Dave has ever been seen without his suit
;and tie, God forbid wearing just jeans and a t-shirt, using an old
;IC-2AT at the local hamfest. Just who is this guy anyway?

That does it. Dave Sumner is VERY active. He's on the air on his
vacation in Prince Edward Island right now, I think (VY2QST).
I made over 5000 contacts last year, but I didn't work you. I
guess you aren't very active.....

It is common, when one moves to a new call area, to get a new
call. It used to be required, in fact. Dave's from Michigan.
I'm from New York. Jim Cain and Steve Mansfield are from
Indiana. Jay Mabey's from South Dakota. Kirk Kleinschmidt's
from Minnesota. Mark Wilson's from New York, Chuck Hutchinson's
from Michigan.... Have you ever noticed how people jump to
conclusions? Finally, I have seen Dave in jeans and a t-shirt,
at hamfests. If I told you what kind of handheld he owned, you
would probably accuse me of conflict of interest.

The Board of Directors and the Headquarters staff are hams,
just like you. The difference is, we're trying to do something
good here, rather than just ridicule the organization.
```

<LOTSA DELETIONS>
;I've never met a section manager or district chief, and don't even know
;who my local representatives are. In todays age of instant
;communications, who needs this archaic and anachronistic structure
;anyway? If the ARRL wanted a truly representative vote on what really
;matters to their constituency, then they should spend about $1 per
;member to send out Business-Reply-Mail, postage prepaid, check-the-box
;bingo cards to each of the members soliciting their votes. Look, I'm
;sorry but in today's age, most people don't have time to call section
;managers, write letters and campaign for change in the old way.
;Checking squares on a bingo card and dropping it into the mail is a
;method which _really_ works, and is more in tune with our times.

If you're a League member, you get a survey every time your
Section Manager and Director elections are held. It's called
a ballot. If you can't take the time to make yourself
knowledgeable enough to cast an educated vote, what gives you
the right to attack us in a public forum? Look, I'M sorry, but
this League bashing is really pointless. The members ARE the
League. Your posting will be seen by HQ staff who have the time
to look at Internet. I would suggest, however, that your
interests can be better served in the manner we keep suggesting
here.

End of sermon.

;And finally, the name QST is the epitome of hobby-jargonism. What;
;a wonderful way to encourage passers by at the newsstand to pick up
;a copy. QST is a term which is instantly recognizable by all members
;of society, one which conveys instant meaning in an intuitive fashion.
;NOT! While the ARRL is considering changing their name, why not give
;the magazine a work over too? How about something like "The Journal
;of the Axxx", whatever Axxx eventually turns out to be?
;
;Well, that's it, my opinion of QST. Any comments?
;
;-fred

Recent items on old/obscure vacuum tubes reminded me of something... How many of the old-timers amongst us remember what a 0Z4 is, what equipment it was typically found in, and how it worked? No fair looking it up until you've thoroughly searched your memory!

Wayne

> Digikey, Mouser etc... and no luck. Anyone have one for sale?

Penstock has (had(?)) TOKO 455KHz ceramic filters, but their minimum order is fairly high (around $25 if I recall rightly). They come in several bandwidths, with the narrowest one being a good match for SSB. Moderately narrow bandwidth, but not a *whole* lot of attenuation (approx 30 db) and 7 db insertion loss.

Penstock is in most professional RF trade rags - email if you need the address / phone #.

2282. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-15 03:08:21 UTC
From: tkelso@afit.af.mil
Message-ID: <1992Aug15.030821.22304@afit.af.mil>
Source record: 285767

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.misc. This week's elements are provided below.

2283. Looking for....

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-15 03:08:27 UTC
From: kd1hz@anomaly.sbs.risc.net
Message-ID: <1992Aug15.030827.1433@anomaly.sbs.risc.net>
Source record: 285765

I was wondering if anyone has come out with a microphone "headset",
similar to what phone operators use, only for use with a mobile
radio... You know, something that automatically keys up the PTT
when you talk, then drops out when you're finished, resulting in
the average mobile operator having two hands to operate his/her
vehicle.... Being that I have a truck w/ a standard transmission,
sometimes driving, shifting, and ragchewing don't mix!

MD

copied from packet:
Msg# TSF Size #Rd Date Time From MsgID To
3497 BF 1349 1 08-Aug 0826 WB1ERG 7404_WB1ERG ALL@USBBS ()
Sb: Standard 800 mhz mod

The message I left earlier on the Standard C5608DA Dual Bander Mod for 800 to 1000 mhz was incorrect, you do not need the Mod Kit from Standard to receive on 800 to 1000 mhz.. If you put your rig in scan mode you will find that it does receive .... Standard said it would not receive without the 800 kit. I just found it does.
.. In case any of you did not read the mod, all you do is Hold the FUNC key and push the up key and you are on 800 or 900 mhz , to reverse this just FUNC key and the Down Key, Wa La... enjoy

2286. Where/how to mount a dipole

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-15 03:21:38 UTC
From: pitonyak@cis.ohio-state.edu
Message-ID: <1992Aug15.032138.27493@cis.ohio-state.edu>
Source record: 285766

I am limited to what I can do with an antenna, I purchased
a cushcraft R7 and found out I can not put it up. I may
be able to get away with putting up two ten foot poles on the roof
and stringing a dipole between them.

any comments on how this would work so close to the roof.
I am sort of at a loss on what to do.

all help is appreciated, I am getting frustrated.

andy

2287. UNIX morse code practice program

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-15 03:52:31 UTC
From: joe@montebello.soest.hawaii.edu
Message-ID: <1992Aug15.035231.2837@news.Hawaii.Edu>
Source record: 285769

I've written a program to help people with UNIX boxes learn morse code.
It seems to be pretty well debugged and working nicely. I wrote it for a SPARC;
Scott Seligman at Stanford added routines to support an HP workstation and
generic X11. It should be possible to support other sorts of devices fairly
easily. (All you have to change is one routine, and you've got 3 examples
to start from.)

It has a rather ridiculous number of options and features. It can
be used to play code, print code, or generate code. It can just let you
look and listen or can test you, either synchronously or asynchronously.
It can speed up or slow down depending on how you're keeping up. It can
ask you letters that you're having trouble with more often. Etc, etc.

Anyway, if you are interested, it is available as "morse.shar" on
hanauma.stanford.edu's anon ftp server. (For those of you without name
servers, that's 36.51.0.16... but you really should get a name server!)

Feel free to redistribute it. If you make any improvements I'd
like to hear back from you. Please abide by the copyright notices. And
have fun!

PS: Keep in mind that since I am giving away the code for free,
I am under _no_ obligation to answer uninteresting questions!!!!!
It's a bit too long to post, and please don't ask me to specially
mail you a copy (unless you're planning on supporting a new device).

PPS: The SPARC routine was written rather lazily (by me), and so may have
trouble keeping up for word speeds much above 25WPM. That was OK for my
purposes, and I'm busy with work, so I didn't feel like taking the time
to write that bit of code more efficiently. If you want the SPARC version
to be able to go faster, you'll just need to make the SPARC driver subroutine
a bit smarter. (Like not recalculating the entire length of sine wave each
time it is called, for example!) That should be very easy to do.

I would suggest that a nice phone call works a lot better and what a better way to spend a saturday afternoon than in an exchange of ideas and a persusaion session. I do like the last suggestion a lot tho. We actually invite ours to parties :-)

In a message of <14 Aug 92>, James N. Price wrote to All:

JNP> Newsgroups: rec.radio.amateur.misc

JNP> Our biggest single problem as a hobby, IMNSHO, is the FCC--both
JNP> in enforcement (they don't do enough) and paying attention to ham
JNP> radio (they don't) when it comes to allocating frequencies and so
JNP> on. The ARRL will have to become more and more a lobbying
JNP> organization which desires/defends a portion of the frequency
JNP> spectrum alongside some very high-powered commercial folks who are
JNP> doing the same. The big difference is: the commercial folks
JNP> do/can make money with the frequency spectrum and hence have a
JNP> rather different set of priorities than we do. And the ARRL is
JNP> what we have to depend on, like it or not. So you might as well
JNP> support it!

Well, all I can say to this is if we got say 10,000 amateurs to write ONE letter to the FCC they would do everything/anything/whatever we told them to do. Its been my experience that the biggest single problem in this hobby (like most others) is that there is total apathy on almost all issues. A few have a discussion in a forum such as this but almost none writes the ARRL, FCC, their Director, calls their Section Manager or anyone else.

The only problem we may have is ourselves.

73, Jay Ws7i

2290. Re: RS-10 on 10m

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-15 08:15:48 UTC
From: michaeln@hpcvnb.CV.HP.COM
Message-ID: <61250014@hpcvnb.CV.HP.COM>
Source record: 285684

i work rs10/11 on once in awhile so here's my 2 cents worth.
1 the metal chair you were using for the ground plane is a little small
and the back of the chair may tend to make the pattern too directional.
2 the tone you heard could have been from a number of things including
the computor u were using to give you the tracking information.
3. you may have been having too much shielding from the wiring in the
appartment you were in.
I haven't tried using the 2600 for satellite but i have used a rs tx100
with mixed results. the internal noise is a bit high for me but i have read
a note here where someone had disconnected the finals on one and was using
a tranverter for mode B. so it couldn't be too bad.
I have worked rs 10 with a 2510 with a bad antenna once so it should work.
try listening for rs10 with your radio in your car or somewhere away from
where you had it last time and see it you have a "birdy" on the beacon
freq. if so try the higher beacon. i usually work rs10 with a dipole so if
nothing else you can take a couple of 8 foot wires and make one that you could
hang on the roof or on the gutter outside. it gets you away from the ground
plane requirement.
if you don't have a birdy in the radio at the beacon freq you may have to
try turning a few things off to find the source. most of the ssb contacts i
work are in the 29.370-29.390 area. i hope this helps. 73's mike nason KA7HBB

2291. Index to the rec.radio.amateur.* Supplemental Archives

The following is a list of informational files for this newsgroup
available via anonymous FTP from ftp.cs.buffalo.edu (currently at IP
number 128.205.32.9).

Questions to beers@cs.buffalo.edu

ampr_coordinators - coordinators for packet IP addresses
antenna_refs - references for articles about antenna designs
arrl-logo.ps - ARRL logo in PostScript format
arrl_bib - bibliographies from ARRL literature (ASCII format)
arrl_digital_minutes - Minutes of the ARRL committee on digital comm.
arrl_fo_jobs - descriptions of some ARRL Field Organization jobs
cal_pd_freq - California police frequencies
callbook.tar.Z - sources for the marvin callsign server v1.3
canadian.Z - Canadian ham database in FCC format
carpet.loop.2 - Antenna for apartments and small spaces
cdnham.Z - New Canadian database
cdnham.zip - New Canadian database
comb6.zip - HF Propagation Predication program
docket_91-36 - information regarding the proposed scanner regs
element_credit - rules about VE credit for earliers exams
elmers_admin - information about the elmers list (see below)
elmers_list - list of elmers on the network
exam_ops - info on exams and exam opportunities
faq_ham_123 - frequently asked questions about ham radio (pts 123)
faq_ham_456 - frequently asked questions about ham radio (pts 456)
faq_packet - frequently asked questions about packet radio
fft.com - EGA/VGA DOS command for spectral display (QST 1/92)
ffth.com - Hercules DOS command for spectral display (QST 1/92)
field_day_92 - field day rules for 1992
florida_antenna - Florida State antenna law info
guide2newsgroups - description of USENET newsgroups dedicated to radio
ham_sat_sum - summary of information needed to get on satellite
hams_on_usenet - list of ham operators and e-mail addresses on the net
hamstacks - information about the question pool stacks
handicap_waiver - info on obtaining a handicapped test waiver
hf_rigs - QST reviews of available HF rigs
ht_info - general information about commercial hand helds
intro_to_swl - info for aspiring short wave listeners
intro_to_scanners - info for aspiring scanner listeners
logos - PostScript logos for various ham organizations
```

mail_order - a database of electronic mail order shops
new_packeteers - helpful essays for new packeteers
newcomers - tips and hints for those new to amateur radio
packet_clubs - organizations you can get more packet info from
packet_gateways - list of gateways from packet to Internet
phone_bbs_list - phone BBSs for ham related issues/software
pio_handbook - ARRL Public Information Officer's Handbook
qsl_bureau1 - information about the ARRL QSL bureau
qsl_bureau2 - "what should I do if" list for the QSL bureau
qst_prodrev - index of ARRL product reviews in QST
repeater_map_proj - description of Electronic Repeater Mapping Project
rfi_tips - good posting about RFI
sol_geo_data - desciption of daily solar geophysical broadcasts
sol_terra_terms - glossary of solar-terrestrial terms
sstv_wefax_info - general help for SSTV and WEFAX users
usenet_purchases - tips on buying and selling via USENET

For readers of this newsgroup both new and experienced, these files are
a de-facto "Required Reading List" to provide definitive answers and
pointers to other sources for questions that come up in this forum.

This is also your archive, so any additional articles, guides, or small
PostScript graphics that you feel would enhance this collection are most
welcome. Submit to Devon via his E-mail address above.

Additional archives out there that have /pub/ham-radio directories are
encouraged to "mirror" these files to provide redundant storage for these
documents. Some of these sites (which may or may not mirror
ftp.cs.buffalo.edu) include:

Revision: 1.1 08/13/92 18:17:07
Changes: date and time created 92/08/13 18:17:07 by pschleck

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, and rec.radio.swap newsgroups. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 3 June 1992.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those

folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the structure we now use.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.packet is for discussions related to (surprise!) packet radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgable folks in radio digital communications can be found here, and anything in the general area is welcome.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.amateur.misc, .packet, and .policy groups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for details. You can also post to rec.radio.swap by sending email to rec-radio-swap@ucbvax.berkeley.edu; if you do it this way, be sure to include an address for responses by electronic mail, as the gateway does not automatically do so.

A Note on Crossposting
======================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

My dictionary says that elegant means refined, free from coarseness
or excessive ornamentation. Thus I contend that many of today's
radios are not elegant because they are mostly flash with little
substance, excessively ornamented.

>I see the same effects in the broadcast world. I've got two shiny new

>
>The point is, there's a place for elegant engineering, and a place for
>brute force and ignorance.

Brute force certainly, ignorance, I hope not. My old transmitter supervisor
used to say "two wires make a light." Meaning that you kept the number
of items that could fail to a minimum in a transmitter plant. Then when
one of those items *did* fail, repairs were simple and quick. Lightning
is definitely *not* your friend and delicate solid state control equipment
has no place in a broadcast transmitter plant. Unfortunately, it's there
anyway and we have to do our best to protect it.

We're currently recovering from a massive lightning strike at our Atlanta
plant. Lightning came in on the power company's wires and thought our
station ground was much nicer than the power company's eight foot rod.
Now we practice safe electricity and have a ground window and suppressors,
$60,000 worth on the input 480 that are now vapor. This was a *big* one.
One of our transmitters had fist sized holes blown in the 8 kV HV power

choke and exploded filter caps. Now that wasn't a big deal. We just fired up the forklift and installed spares, the choke weighs over half a ton. But lightning also broke down the 480 three phase step start contactor and said hello to our 24 volt solid state control ladder. Nothing survived. We're still operating with clip leads bypassing the safety devices and hand switches wired in to do sequencing while Harris makes replacement boards. Meanwhile, our old RCA, complete with big stepper relays, just keeps humming along. I'd say the RCA was a more elegant design for it's intended purpose. Too bad RCA was murdered. (David Letterman and I see eye to eye when it comes to GE corporate management.)

>Do you know the designation? or the exact uplink freq?

Well, what you are describing sounds like Mode B operation. It's definitely *not* FM. Both Oscar 10 and Oscar 13, when it's in mode B, take a 435.xxx uplinked signal and downlink it in the 145.xxx band. But these are *linear* transponders of limited power and FM is most definitely *not* encouraged. SSB or CW are the preferred emission modes for use through these satellites. There *is* a mode S transponder that takes FM signals up on 435.xxx and downlinks them in the 2.3 GHz band, but it's of limited availability and limited use. The 200 kHz wide mode B linear transponders, or translators, allow many SSB and CW signals to occupy their passband at the same time. This is different from a FM repeater where only one signal is recovered and regenerated at a time. FM is not an efficient use of transponder power since the full carrier power is present even when no intelligence is being passed.

Now you may already know all this and are asking if there really is an FM repeater using these frequencies aboard an amateur satellite. If there is, I haven't heard of it. Seems to me it would be useless from congestion most of the time.

>to the oscilliscope inputs would be very bad.

Unless the o'scope is expressly designed for the purpose, transmitting into it is not healthy. What you want is a 30 db coupler, or tap, that goes in the line between your transmitter and a dummy load or antenna. Coming off the tap will be a signal attenuated 30 db that your o'scope can handle. If your transmitter is high power, say approaching the legal limit, you may have to add additional pads in the tap line. Most scopes with 50 ohm inputs will safely handle 1/8th watt continuously and 1/4th watt intermittantly, but consult your manual to be sure. I use a 30 db Narda coupler with my Tek 2445A at power levels up to 100 watts. Above that, I put a 10 db pad in the line from the coupler to the scope.

If your scope is a good one, don't mess around with ad hoc coupling methods. Get a real coupler. If you have access to a lathe and good power measuring equipment, such as a Bird, I can tell you how to make your own couplers from a type N Tee and barrel that are good thru 500 MHz. If you try to use a random impedance coupling, you'll be disappointed with the frequency response of the result, IE the scope will lie to you.

A scope is a useful tool for looking at linear modulation modes and for checking for hum caused by poor PA voltage regulation, but is fairly useless for checking FM equipment. There a spectrum analyser is a much better tool. Besides the coupler, another useful accessory for checking linear mode signals is an envelope detector that you can put inline between the scope and the coupler. This will let you look at baseband signals. These are easy to build.

>David, N5TLZ

You have found one of the test-modes on RUDAK, the digital communication
experiment on board of OSCAR21. OSCAR21 is built into a Russian measuring
satelite, GEOS 1, that, because of the changes in Russia, isn't
used now.

OSCAR21 has two linear transponders on it. Both of them are built in russia.
RUDAK-2, built in Germany by AMSAT-DL, is connected to one of them; it has
several input frequencies and several output frequencies. It can transmit/
receive several different modes, including FSK and PSK. The modulation can
also be generated via software allowing modes like RSM. All those receiver/
transmitters are connected to a CPU consisting of a 65SC02 and a RTX2000
DSP processor. It can be programmed to do several different things. It really
is too complicated to explain all this, check the proceedings of the
AMSAT-UK satelite colloquium or the 9th ARRL networking conference.

RUDAK-2 has had some difficulites. An amplifier in the input stage sometimes
starts to oscillate and it is very difficult to stop it. There have been
contact problems in an input attenuator. Because of the changing situation
in Russia, the command station for GEOS1 was closed for a while with
all on-board electronics switched off. The current limiter of the power supply
is set only 10% above average current draw: if RUDAK starts computing real hard,
it would draw more current (CMOS technology) and trip the current limiter.

On one of the input receivers, there is a direct analog audio output, i.e.
before the FSK demodulator. It is fed to the RTX2000 for test purposes. As a
test, the RTS2000 fed this signal to the FM transmitter directly, making
a FM relay. This was done mainly for testing, but was great fun to use.
Peter DB2OS told me he would start some other experiments soon and I have
not heard the 'repeater' since, just telemetry now.
I don't know when (if) the repeater would be restarted, it was only a test-mode,
but ask Peter himself via OSCAR22.

While at it, this year's AMSAT-UK colloquium had a great topic about Phase 3D,
the replacement for OSCAR10. Building this vehicle costs a lot of money.
The potential possibilities are enourmous: it will have a 10DB better

link budget as the older birds so it can be worked with an easier installation.
If you're looking for a Good Cause for earnings from a hamfest, Phase-3D
is it! Ask the AMSAT organisation in your country, or ask Ron Broadbent,
G3AAJ, Karl Meinzer, DJ4ZC, or AMSAT-NA what you can do..

Thanks, 73

From: enge@almaden.ibm.com
Message-ID: <9208151619.AB16739@ucsd.edu>
Source record: 285679

Msgid : $RACESBUL.235

TO: ALL EMERGENCY MANAGEMENT AGENCIES/OFFICES VIA THE ARS
INFO: ALL RACES OPERATORS IN CA (ALLCA: OFFICIAL)
ALL AMATEURS U.S. (@ USA: INFORMATION)
FROM: CA STATE OFFICE OF EMERGENCY SERVICES (W6HIR @ WA6NWE.CA)
2800 Meadowview Rd., Sacramento, CA 95832 (916)427-4281
RACESBUL.235 DATE: Aug. 17, 1992
SUBJECT: MGT - FCC Rules Part 97 RACES

QUESTION: Where does it say in the FCC Rules that the
RACES is a governmental organization?

REPLY: It doesn't. What the FCC Rules do say is that a
group of Radio Amateurs can only function as a RACES unit under
the control of a properly constituted Civil Defense agency.
(Reference: FCC 97.163a, 97.169b, 97.175, and 197.177.) The
RACES unit remains an Amateur Radio group performing a unique
communications service for a particular civil defense agency. By
its nature as a service to local government under local
government supervision, activation, and authority it becomes, in
effect, a quasi-governmental function.
There are many Radio Services. There is Amateur Radio,
Local Government, Fire, Police, Business, Special Emergency,
Personal, Land Transportation, Aviation, Citizens and many more.
They all have several things in common. They define eligibility,
technical parameters, permissible communications, frequencies of
operation and other points. Let's take the Police Radio
Service for example. It tells a local government how to apply
for authorization for and the use of the Police Radio Service
frequencies, but it does not tell a local government how to run
it's police department and the use of its personnel. Exactly the
same applies to the RACES subpart of the Amateur Radio Service
rules. The rules do not presume to tell a government how to
organize and administer Amateur Radio operators in a RACES unit
any more than it tells any jurisdiction how to run its police
department, fire department, emergency management agency and so
forth. The Rules do require that a RACES organization be a part
of the local government's civil defense structure.
The FCC Rules do require that an Amateur Radio operator
have a copy of the latest Rules. The FCC rules do not require
any local government, however, to use the RACES or any Amateur
Radio operators. Those who serve consider it an honor and a
privilege. --- Stan Harter, CA State ARS Coordinator, KH6GBX

EOM

and can be retrieved using FTP.

2300. New packeteer frustration

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-15 16:58:55 UTC
From: ewing-martin@CS.YALE.EDU
Message-ID: <1992Aug15.165855.19445@cs.yale.edu>
Source record: 285686
Cross-posted to: rec.radio.amateur.packet,rec.radio.amateur.misc

After many years of sitting by the packet sidelines, I've set up a KAM and started decoding the burps. As someone who uses the Internet daily, this has been an eye-opening experience for me.

As someone recently noted ham packet, as currently practiced, is an adventure in low-performance communications (but cost-effective). Yeah, with incredible patience and luck, I've managed to connect from Philadelphia to Maine. I've seen umpteen users competing for a single 1200 baud port to a PC. And I note that 10s of kHz of precious HF spectrum are taken up by very unfriendly robots chatting at **300 baud**. (They won't give you the time of day, and the throughput is abysmal.) Now I see there's a big brouhaha about the ARRL not defending these terribly inefficient mail operations to the maximum of its ability.

The contrast with the Internet is incredible. I can easily transfer a megabyte per minute across the country, and I am somewhat annoyed I can't do better. I can send dozens of e-mail messages around the world and often get replies in minutes. But you all know that.

My question here is where does one go for information about digital ham networking plans - especially the (very logical) use of Internet links for long haul? It's not in QST, I think. :-)

Until I get better adjusted to VHF packet, you'll probably find me on 20 m AMTOR. There's a friendly medium! Not much good for downloading software, however.

Cheers and 73s, Martin, AA6E

>

You're not suppose to NEED a balun, the twin lead feed line is suppose to act as a matching section to match 75ohm coax to the antenna.

I'm curious, is it a 1:1 balun or 4:1 balun?

I too use a 20m 1/2 wave dipole at 10-15 feet high (slopes a little) and it works great. It doesn't have a balun either, just solder the coax directly to the antenna. They're easy enough to make and string up, if your cousin is really interested in 20m he should build one. Personally, I like having several antennas in the air, then when you hear someone you can switch to the antenna that works best to work them.

>contesting which in turn fuels the success of QST and in turn, the
>league.

I'm curious: how much extra advertising revenue does the League get
because it supports contesting? How much does the League pay to
administer the contests it sponsors? Does the difference cost the
League or add to its gross income? Do you know? Or are you just
stating your firmly held opinions on the basis of no facts whatsoever?
Contesting is a perfectly valid operating activity (one that I have
little interest in). For the ARRL to support it is simply to support
a facet of Amateur Radio. I *thought* that's what we were here for.

>The ARRL could not make it without contesting.

I'm particularly interested in seeing the evidence you have that backs
up *that* statement.

>>> Re: voting and League Membership

>extrapolation can become accurate.

Ah, the Ross Perot school of democracy! Me, I'm from the old school,
the one that says that if you are too apathetic--or lazy--to write a
letter to your Director or pick up the phone and call him/her, your
opinion *shouldn't* be considered because you obviously have no
commitment to the issue under consideration. So why not leave the
decision to those who *do* care enough to make their voice heard?
Simply polling the entire population and abiding by the resulting tally
means that the decision is being made by a group the majority of which
didn't bother to educate themselves on the issues or give them any
serious thought. No, I'd rather have decisions made by thoughtful,
informed people.

>>>I've never met a section manager or district chief, and don't even know

>have a few suggestions regarding the role and content of QST. On the
>other hand, I think my opinions would better heard in a larger forum
>(such as this network) and possibly have a greater overall ultimate
>effect.

Fred, you are remarkably ignorant about ARRL. The SM has no special
influence over QST content (other than his/her contribution to "Section
News.") QST content is determined in part by the staff in Newington and
partly by the Board of Directors. What you *should* talk to your SM about
are those facets of the Field Organization that the SM is responsible
for overseeing. And, by the way, the "district chief" is called the
"division Director."

>After all, my local SM is likely to forget what I said come
>convention time, but at least I know that there would have been a
>chance that the ARRL would have seen my opinions here. In fact, I'd

>say that the chances were quite high that they're reading this right
>now, but won't dare risk exposing themselves to engaging in a frank,
>over-the-net discussion on any topic.

A frank discussion is only useful when the parties taking part in it
are well informed. You are, of course, entitled to your opinion.
Fortunately, I'm entitled to give uninformed opinions exactly the
respect they deserve.

Frank enough for you, Fred?

2304. Re: New packeteer frustration

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-15 20:45:31 UTC
From: feustel@netcom.com
Message-ID: <q47m26a.feustel@netcom.com>
Source record: 285693
Cross-posted to: rec.radio.amateur.packet,rec.radio.amateur.misc

I also recently purchased a BayPac unit to connect my computer and my handheld to try packet. My impression is that packet is just toooo slow for me. I can connect to Australia via ftp at kilobytes/sec. This makes packet seem rather useless to me at the moment, although I would happily be educated about useful applications of packet.

--

Dave Feustel N9MYI <feustel@netcom.com>

Given Civil Seizure, from the DEA's point of view, winning the War on Drugs would be killing the Goose that lays golden eggs.

It's also hard to tell which group is up to more no-good: cops or crooks.

2305. BULLETIN: Monthly Reports for July 1992 Are Now Available

/\

SOLAR BULLETIN

15 August, 1992

Monthly Reports for July 1992

/\

MONTHLY REPORTS OF SOLAR GEOPHYSICAL ACTIVITY FOR JULY ARE NOW AVAILABLE:

The monthly reports of solar and geophysical activity for the month of
July 1992 are now available through anonymous FTP from the following sites:

solar.stanford.edu <--> 36.10.0.4 <--> "pub/1992" and subdirectories
nic.funet.fi <--> 128.214.6.100 <--> "pub/dx/solarreports" and subdirs
xi.uleth.ca <--> 142.66.3.29 <--> "pub/solar/1992"

Also, preliminary monthly ionospheric data are available from either of the
last two sites above (nic.funet.fi or xi.uleth.ca). Data reported includes
M(3000)F2, foF2, MUF(3000)F2, and TEC.

The files to get are:

"julflr.doc" - Summary of Solar Energetic Events for July 1992.

"julmag.doc" - Summary of Global Geomagnetic Activity for July.

"iono-jul.zip" - Summary of Ionospheric Data, compressed using ZIP.

"iono-jul.zoo" - Summary of Ionospheric Data, compressed using ZOO.

"iono-jul.tar.Z" - Summary of Ionospheric Data, TAR'd and COMPRESSed.

"jultec.zip" - Summary of Global Total Electron Content (TEC),
compressed using ZIP.

"jultec.zoo" - Summary of Global TEC, compressed using ZOO.

"jultec.tar.Z" - Summary of Global TEC, TAR'd and COMPRESSed.

"sgdb-jul.zip" - Archive of all Daily Solar Geophysical Data
Broadcasts (SGDBs) for July using ZIP.

"sgdb-jul.zoo" - Archive of all SGDBs, compressed using ZOO.

"sgdb-jul.tar.Z" - Archive of all SGDBs, TAR'd and COMPRESSed.

** End of Bulletin **

2306. Source code for Super Keyer II wanted

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-15 21:22:49 UTC
From: schriste@uceng.UC.EDU
Message-ID: <1992Aug15.212249.18300@uceng.UC.EDU>
Source record: 285700

Hi,
The 1992 ARRL Amateur Radio handbook shows the schematic for
a computer controlled iambic keyer called (I think) the CMOS Super
Keyer II. It is based on one of the 68HC705C8 series chips. Since I
know the 68HC11 like the back of my hand, I would like to do the
project with that chip.

Does anyone know where the source for this project might be
located? I can FTP.

Thanks,
Steven

P.S. I just build a home-made iambic key, which is fully adjustable w/rt
the spring tension, amount of "play," and all aspects of the key's "feel."
Does anyone know how much an iambic key costs professionally made? I feel
pretty good, since it cost me a total of $15.00 or so....

2307. Re: Orbiting FM Repeater ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-15 21:35:05 UTC
From: allbery@NCoast.ORG
Message-ID: <1992Aug15.213505.9460@NCoast.ORG>
Source record: 285691

As quoted from <1992Aug15.130551.13344@ke4zv.uucp> by gary@ke4zv.uucp (Gary Coffman):
+---------------
| In article <77558@ut-emx.uucp> wdlee@ccwf.cc.utexas.edu (david lee) writes:
| >Netfolks,
| > My buddy just told me about an FM repeater on board a satellite.
| >He said the uplink freq. is near 430 MHz, and the downlink
| >is 145.985 MHz. What is the designation of this satellite?
| >I need to look up its orbital elements in the NORAD lists.
| >Do you know the designation? or the exact uplink freq?
|
| Well, what you are describing sounds like Mode B operation. It's definitely
| *not* FM. Both Oscar 10 and Oscar 13, when it's in mode B, take a 435.xxx
| uplinked signal and downlink it in the 145.xxx band. But these are *linear*
|
| Now you may already know all this and are asking if there really is an FM
| repeater using these frequencies aboard an amateur satellite. If there is,
| I haven't heard of it. Seems to me it would be useless from congestion
| most of the time.
+---------------

Surprise! AO-21 is in fact doing this --- and yes, it *is* ordinary NBFM, not the usual sideband. Downlink 145.985, uplink 435.195 if I remember correctly; it's in operation 4 minutes out of every 10 with 9600 baud packet taking up the rest of the 10 minute period. (Actually, there seems to be another speed of PSK packet as well, but I have only an unbuilt PSK modem kit and no SSB gear to use it with so I have no idea what speed it is.)

It's busy, but no worse than your average pileup.

NOTE: I remember the downlink frequency but am unsure about the uplink.
Check with someone who *KNOWS* before you transmit!

ZCZC AE05
QST de W1AW
DX Bulletin 42 ARLD042
From ARRL Headquarters
Newington CT August 14, 1992
To all radio amateurs

SB DX ARL ARLD042
ARLD042 DX news

Thanks to Bob, WB2CJL, the Western New York DX Association, Ellen, W1YL/4, Paul, KB1BE, and Andy, G4ZVJ, for the following DX information.

BANGLADESH. There is a lot of activity from this one. Jim Smith, VK9NS, signed S21ZA for approximately one week. Rudi, DK7PE, is operating as S21ZC. Look for him around 0130z near 14010 kHz. Also keep an ear out for S21A. Eric, WZ6C, has been issued the call sign S21AB, although he has yet to be heard on the air.

ANGOLA. Standa, OK1FGC, has been very active as D2FGC. Most of his activity is on SSB, however he has been worked on CW on 14015 kHz and the WARC bands. Check 14199, 14256 and 21253 kHz for SSB. QSL via the 1992 Callbook address of OK1AJN.

F6BLQ/D2 is now active from Luanda and QRV until September 3. Listen around 14120, 14260, 18120, 21170 and 21260 kHz between 1200 and 1330z and 1800 to 2300z on weekdays, and 0800 to 2300z on weekends. QSL via F6ELE.

IRAN. Romeo, 3W3RR, appeared on the air August 9 and his stay will last through the end of this week. Look for his CW around 7 kHz up from the bottom of the band on 20, 15 and 10 meters. SSB activity is around 14195 and 21295 kHz. Also check the WARC bands. QSL this operation via NT2X.

SAINT VINCENT. Mitsu, JH4IFF, has been on the air using the special call sign J80X. This operation is CW and RTTY only. QSL Mitsu via his home call.

ZIMBABWE. You may run into Z2 activity from mid-August through September. Check between 14190 and 14250 kHz for the medical missionary team of N7SPQ, KB7DRI and W4PJS. The objective of the trip is to bring much-needed medical skills to a remote fishing village on Lake Kariba, a reservoir on the Zambezi River in northwest Zimbabwe. After completion of the trip, obtain QSL information from Graham Hicks, W4PJS, 900 Main Avenue, La Grande, OR

97850.

AMERICAN SAMOA. Andy, G4ZVJ, will sign KH8/G4ZVJ from August 12 to September 9 from Tutuila Island. Operation will be mainly CW with some RTTY/AMTOR. QSL via G4ZVJ.

SPECIAL EVENT STATION. To commemorate the 50th anniversary of the landing of the Allied Forces in the Dieppe area of France on August 19, 1942, ARADAS, the Dieppe Radio Club, will be active on August 15 and 16 from 0700 to 2000z. They will sign TM5JBL, with operation on 10, 15, 20 and 40 meters. QSL via the bureau or direct to PO Box 2005, 76070 le Harve Cedex, France.

INDIAN OCEAN. FR5ZU states that he will be operating from Europa, Glorioso and Juan de Nova sometime in September.

BENIN. Sigi, DJ4IJ, will return to Cotonu for a month-long stay starting around the end of December. He will be signing TY1IJ.

SB DX @ ALLBBS $RTDX0814
RTTY DX Notes 14 August
RTTY DX Notes for week ending 14 August, 1992 (BID RTDX0814)

Well, here we are again, back to normal. Well at least that is what
the doctors said, so we must believe them for the time being. We must
of course, thank Luciano (I5FLN) for his excellent work while i was
away. It is not easy to take over someone elses work at a short
notice, but Luciano does it very well. Looking at the bands over the
past week, one wonders where all the DX is hiding, but from reports
there must have been some around. For that we are thankful.

Our thanks this week go to DJ3IW, I5FLN, NT3B, TG9VT, VE3XJ, VK2EG,
WB2CJL and W2JGR and the Twin Cities DX Packet Cluster Network. Thank
you all for your assistance, and hope that some of the good DX comes
to your place.

Notes Of Interest.

Intermittent remarks indicate that Jim Smith (VK9NS) is, or was, active from Bangaladesh (S2). But only one sighting has been reported and that was for Saturday 8th August. No further reports have been received. One wonders?

Romeo (of 3W3RR FAME) is now in Iran and signing 9D0RR. He will be on RTTY for a short time. QSL via NT2X.

9X5LJ will be going QRT for a month from 17th August. He will be on vacation.

Jack (FR5ZU) is still on track for his visit to Europa, Glorioso, and Juan de Nova during September. Jack says that he will definitely have RTTY operations.

Cards for the KH9 operation by VK9NS and company have been received in the states. Good work, JIM.

It is believed that the cards for the VP8SSI and VP8CBA operation have been printed, they are now being processed and should be in the mail shortly. At least that is what some of the reports say. We have to believe someone.

Oscar-21 was running one experimentally for a while. I don't have the freq's, but it was 430something up and 2m down. It *was* doing FM for the first 4 minutes out of every 10, but that could have changed. A friend of mine heard and thought he was getting a band opening until he realized that he was hearign new york from traverse city MI. He was just listening with a 2m J-pole.

is published every week and is made available for unlimited distribution.

* KITSAT-A/OSCAR-23 NEWS *
==========================
A new "star" was born last week with the successful launch of KITSAT-1,
OSCAR-23. Testing and loading of spacecraft operational software is
progressing as the spin rate of the satellite decreases. Once the tests
are complete, the satellite will be commissioned for general use. Until
then, please do not attempt to transmit to the satellite.

The following is a current NASA Two-Line element set for KITSAT/OSCAR-23:

KITSAT-1
1 22077U 92 52 B 92225.06456239 -.00172574 00000-0 -81247 0 0 58

* THE FREJA SCIENTIFIC SATELLITE *
==================================
The FREJA scientific satellite, designed and built by the Swedish Space
Corporation is intended for research into the aurora. It will be
launched "piggyback" by a Long March 2C rocket from the Jiuquan
Satellite Launch Center in China (41N, 100E) in the beginning of
October 1992. Launch is planned for October 5 at 0615-0800 UTC.
FREJA is planned to enter an orbit with perigee at 605 km, apogee at
1748 km inclined at 63 degrees. The argument of perigee is planned to
be 262 degrees. FREJA is a sun-pointing spinner (10 RPM) with a 2.2m
diameter weighing 257 kg at launch and 215.5 kg in its final orbit.

The CZ-2C puts the Chinese FSW-1 main satellite and FREJA into a 203-317
km parking orbit at a 63 degrees inclination. FREJA's orbit must be
raised to reach scientifically interesting regions and to keep the
satellite from decaying. A Thiokol STAR 13 A rocket motor fires at the
southern apex of the parking orbit to give FREJA an apogee of 1748 km.
As the apogee is reached approximately 50 minutes later, a Thiokol STAR
6B rocket motor fires to raise perigee to 605 km, high enough to keep
```

the orbital attitudes unchanged for 1 to 2 years.

FREJA will transmit low-speed telemetry (1200 baud V.23) on 400.550 MHz (in addition to high-speed telemetry on S-band, 2208.1629 MHz). The transmitter has 2 watts of RF output power. The V.23 signals are frequency modulated on the carrier and can be received on a normal NBFM scanner receiver. A circularly polarized antenna is recommended since the transmit antenna is a simple quarter-wave whip giving linear polarization.

The satellite will transmit a 20 second long message containing:

- Housekeeping telemetry from the platform and experiments.

- A one-page operational message from the FREJA Operations Center (FOC) at Esrange, Kiruna, Sweden. Typical contents are: Orbital parameters, attitude, spin rate, experiment operational modes, etc.

A decoding, readout, and display software package for operation under MS-DOS will be available from SSC after launch. This link is called the LSL (Low Speed Link) and will operate twice per day; one pass over Europe and one pass over North America. The transmitter will be on

- Over Europe on passes with the ascending node at 10 degrees west +/- 23 degrees, or 120 degrees west +/- 23 degrees, whichever occurs closest to normal working hours.

- Over North America on passes with the ascending node at 113 degrees east +/- 23 degrees, or 120 degrees west +/- 23 degrees, whichever occurs closest to normal working hours.

[Info via Sven Grahn, FREJA Project Manager, Swedish Space Corporation]

* WORLD SPACE CONFERENCE NEWS *
==========
Hans van de Groenendaal ZS6AKV, President of SA AMSAT will be delivering a paper at the World Space Congress 1992 to be held in Washington DC from August 28 till September 5.

His paper "Use of Satellite and Satellite signals to inspire interest in Natural Sciences in Developing Countries" has been scheduled in the session on Educational Opportunities in the Space Life Sciences on Saturday September 5.

The paper will review current and planned Amateur Radio Satellites, SAREX missions and weather satellites and the opportunities offered for projects in schools to develop an interest in the natural sciences.

The value of Electronic Clubs at schools as a means of introducing a wide spectrum of pupils to the sciences will also be discussed and role satellites and in particular Amateur Radio Satellites can play, explored.

Engineering is a _lot_ like art.

Some circuits are like lyric poems (the Tektronix transmission line
amplifier is an example); some are like army manuals; and some are
like Hitchhiker's Guide to the Galaxy...

W3OTC makes some excellent points about the duty of the engineer to produce an _economical_ design.

As for the fan controller with 40 components, if it's as bad as it sounds, then I suspect it's the result of the same kind of incompetence that produces 750-page doctoral dissertations: The author (designer) simply puts in everything but the kitchen sink! He starts with a block diagram, sees no need to simplify any of the blocks, does not think about making some of the blocks much smaller by changing the specs slightly, or making a block do double duty, etc. etc.

There are people who cannot write concisely, and there are people who cannot design concisely. I think it's much the same problem.

Source record: 285704

I have a high brighness "jumbo blinking LED" which I bought at a Radio Shack last year (cat no. 276-020). The LED has its own MOS flasher built in and works well connected to 3 penlight cells. It can really be seen for quite a distance at night.

QUESTION: Does anyone know where these little goodies can be purchased in lots of 10 or so - the R.S. carded individual component price is rather steep. I want to connect 3 or 4 of them together to make flashers for the kid's bikes.

Please reply to rafi@bguvms (bitnet).

Thanks and 73,

Earl, 4Z4TJ

2320. Zig-Zag Antenna - CAUTION!

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-16 11:34:37 UTC
From: wvanhorn@magnus.acs.ohio-state.edu
Message-ID: <1992Aug16.113437.3212@magnus.acs.ohio-state.edu>
Source record: 285709

There have been several postings over the last few weeks about the "Zig-Zag Antenna" featured in an article in RF DESIGN, March issue, and in follow-up articles by Bill Orr, W6SAI, in CQ magazine. Be very careful before investing a lot of time and effort on this antenna design!

The antenna was invented by Feigenbaum and assigned to the U.S. Army. The same Feigenbaum was the author of the RF DESIGN article.

The claims for the antenna made it seem very attractive for ham use, so I modeled it using Brian Beezley's MNC software (version of MINNINEC). I initially used the design data from the RF DESIGN article. My results were so bad that I thought there must have been some errors in the article, so I got a copy of the original patent. It is very specific in the parameters of the "preferred embodiment", so there could not be any mistakes.

When I modeled it again, the results of the analysis were equally bad. Far from being "broadband", its input impedance ranges all over the lot from bad to ridiculous as the frequency is changed. The main radiation lobes vary from forward to backward to broadside to straight up on the different bands! The "antenna efficiency" ratings range from poor to almost zero on the hf ham bands.

I am no antenna expert and freely confess that I may have been mistaken in my modeling, so I corresponded with Bill Orr and sent him my results. He may or may not see fit to publish more information in his CQ column. I have no more interest in the antenna and can only warn others to be careful!

>
>One thing that QST might do would be to have a "My turn" column for
>general opinion pieces, including hopefully some from Fred.

They do, it's called Op-Ed. AA6YD wrote one in the Feb 92 issue that ought to be required reading for DXers before they're allowed to fire up the kilowatts every day. But then denial is part of the problem isn't it?

I thought Fred's critique of QST was pretty accurate. It *is* a club newsletter, that's what it's supposed to be. The Feb issue has 3 pages of administrivia, 15 pages of modestly technical content, and 101 pages of DX and public service lists and trivia, followed by 110 pages of advertising. Now the Summer issue of Communications Quarterly has 87 pages of solid technical material, 15 pages of advertising, and 2 pages of administrivia. If it were monthly, that would represent 29 pages of solid technical information a month. The July 73 has 24 pages of technical material, 8 of DX oriented material, 9 of product reviews, 3 from Uncle Wayne, and the other 44 pages are advertising and fluff. A representative issue of the late lamented Ham Radio has 43 pages of solid technical material, 3 pages of DX fluff, 3 pages of administrivia, and 40 pages of ads. A representative QEX, Sept 91, has 5.5 pages of technical material, a CW filter (sigh). And the rest of the 20 page issue is a flawed article on calculating the mass of the Earth (sorry Paul), fluff, Gateway old news, and ads. I don't subscribe to the DXer's wet dream, CQ, so no page counts there.

Technical content in percent by page count:

Communications Quarterly 83.6%
Ham Radio 48.3%
QEX 27.5%
73 27.3%
QST 6.6%

Magazines selected at random from the pile on the desk. Technical content determined by presence of a circuit diagram, math, and similar features pertaining to technical *radio* being present somewhere in the article.

It should be clear that QST is the *least* technical of the listed ham magazines. I think that's sad for the official organ of a technical hobby. I get several club newsletters here, and most

of them run around 8 pages. On an average month, 5 of those pages will contain technical articles or tips and the remaining 3 will be club business and local ads, for 62.5% technical content. That's a whole lot better than the ARRL's club newsletter. But, ARRL's membership is only around 150,000 out of the 450,000 or so amateurs in the US, about 33%, and the majority of ARRL members *may* be uninterested in technical subjects. I haven't seen a survey, I'm just assuming the ARRL does market research like most publications. So I guess the club paper is about what the members want.

2325. Propagation Announcer ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-16 13:07:26 UTC
From: RHAREL@FAB8.INTel.COM
Message-ID: <9208161305.utk14585@FAB8.intel.com>
Source record: 285710

I'm wondering if there is anything on the market available that can announce over a repeater the propagation conditions for any given time ?
I'm considering a project that would monitor Shortwave broadcasts S/N ratios and would drive digital canned messages concerning propagation conditions. For example, I'm in the Middle East and want to know if there are conditions on 20 meters to the U.S. - through our local repeater, I would hit a few tones and it would indicate if it is receiving the VOA on 15.205 (close enough) and at what S/N ratio. The syatem would 'listen' for several known broadcast signals and know where and when to listen.
If such a system is available off-the-shelf, I'd rather buy it.
Any feedback ?

I'm a new ham (just passed my Technician exam this past Saturday), and
I'm looking at getting a HT as my first rig.

Marc,

I am a proud owner of an Alinco DJ-580T dual band HT. It is the best
and only radio I have ever owned. I highly recommend it and pretty
price comparitive with other dual band HT. Run's just below $390. I
would also like to recommend taking a look at an AES catalog. They
are very competitive and offer great prices.

Good luck,

Charles

From: charles@greyrock.mso.colostate.edu
Message-ID: <CHARLES.92Aug16091855@greyrock.greyrock.mso.colostate.edu>
Source record: 285716

I am interested in making my HT more useable in my car. I have thought about buying an antenna and then hooking it the antenna connector on the HT. I have 12v from the car to give me at least 5w. What I was wondering is how I can boost the power to say 25w. I've thought about making a power amp but all the schematics I have found seem to use tubes which doesn't seem to be very practical for a car. Does anyone have schematics or suggestions for a non-tube amp for the car?

Thanks,

Charles

>Gary KE4ZV

AO-21 does carry an FM repeater mode and it is currently operational.
It works extremely well. All users work in a round table like fashion
just as most do on the local FM repeaters. The transponder schedule
has recently changed but as far as I know it is still on a 10 minute
cycle. This cycle is divided into 3 segments: 1) Telemetry,
2) Digital voice talker, and 3) FM repeater Mode. The frequencies
for AO-21 are: Uplink 435.015 and Downlink 145.987.

Give it a try! Signals are always very strong here with only a
vertical antenna just above the Apex of the roof.

Fortunately, ham-radio isn't a technical hobby. Maybe it is to you, but it doesn't *have* to be to anyone unless they want it to.

I will admit that the various section information, DXCC lists, etc., have little or no interest to me - but who am I to judge for the remainder of those in the ARRL?

I believe that the ARRL needs to have more than one publication - or, perhaps one publication with several inserts, of which you get that insert that interests you the most. So, you have general information and advertisements, club news, and then a special-interest section which highlights those aspects of the hobby you are interested in most?

Expensive to produce? Well, moreso than today's QST, I'm sure. However, in the long run, you maximize the influence of QST's presence on the hobby, by making it something each ARRL member looks forward to receiving, not something they simply receive and toss aside.

This in itself is an improvement. That's the mode I've used for
quite some time.

> I have 12v from the car to give me at least 5w.
> What I was wondering is how I can boost the power to say 25w.

I don't know about homebrew, but there are certainly autosensing
amps that fit the bill perfectly. My favorite is the RF Concepts
dual band amp that is installed in my wife's car. It's really simple.
FT470->AMP->Antenna. Automatically senses both bands. Has receive
preamp as well.

SB SAT @ AMSAT $ANS-228.01
KITSAT-OSCAR-23 IS BORN!

HR AMSAT NEWS SERVICE BULLETIN 228.01 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 15, 1992 BID:$ANS-228.01
TO ALL RADIO AMATEURS BT

KITSAT-OSCAR-23 (KO-23) IS BORN!

With a picture perfect launch from the Kourou, French Guiana spaceport, and a flawless separation from the third stage of an Ariane rocket, KITSAT-OSCAR-23 (KO-23) was born this week shortly before midnight August 11 (UTC). KO-23 joins a proud family of OSCARs that provide packet radio store-and-forward capability, ie., AO-16, LO-19, FO-21, and UO-22. In addition, KO-23 goes even one step further than its predecessors. It contains two built-in charged coupled device (CCD) cameras capable of providing either 4 km resolution or 400 meter resolution. Another exciting aspect which sets KO-23 apart from the other PACSATs is its Digital Signal Processing Experiment (DSPE). Many OSCAR users have encountered the power of Digital Signal Processing (DSP) whenever they use AO-21's FM transponder. Still, more have heard the AO-21's digital voice synthesizer speaking foreign language messages of greeting. KO-23 will take this DSP application one step further by allowing the user to leave voice mail. In other words, "store-and-forward" voice messages could become a standard mode of operation.

Look for KO-23's downlink signal at 435.175 MHz. When KO-23 becomes operational in a few weeks, users can access the 9600 baud FSK BBS on the uplink frequencies of 145.850 MHz or 145.900 MHz. However, until such time as the KO-23 Ground Command Team releases the satellite for general use, ALL ARE ASKED NOT TO UPLINK TO KO-23.

KO-23 is a joint effort between the University of Surrey (UoS) and the Korean Advanced Institute Of Technology (KAIST).

KO-23 STATUS REPORT

HR AMSAT NEWS SERVICE BULLETIN 228.02 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 15, 1992 BID:$ANS-228.02
TO ALL RADIO AMATEURS BT

G0/K8KA Provides KITSAT-OSCAR-23 (KO-23) Status Report

Jeff Ward (G0/K8KA) and the ground controllers at HL0ENJ report that the KO-23 commissioning process is going extremely well. They have reached the following milestones:

1) The on-board computer (OBC) software has been uploaded which include the such important functions as housekeeping, the file system, command software, and the Attitude Determination Control and Stabilization (ADCS) software.

2) The "tumble-rate" of KO-23 has been reduced drastically now that the ADCS has been firing the magnetorquers. With the "tumble" rate coming down, this will facilitate a smooth deployment of the gravity gradient boom. The boom helps keep KO-23 pointed towards the earth.

Jeff requests that stations with the "foot-print" of HL0ENJ please not QRM the uplink channels on KO-23. This will only prolong the commissioning process. For those who would like to decode the telemetry from KO-23, you can obtain a copy of the DTLM.EXE program from AMSAT-UK.

Stay tuned to the AMSAT Nets and the ANS bulletins for updates on the status of amateur radio's newest OSCAR.

[The AMSAT News Service (ANS) would like to thank G0/K8KA and the ground controllers at HL0ENJ for this status report.]

AO-16 UPDATE

HR AMSAT NEWS SERVICE BULLETIN 228.03 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 15, 1992 BID: $ANS-228.03
TO ALL RADIO AMATEURS BT

WB9ANQ Provides AO-16 Update

A joint test team, composed of members from the AO-16 Ground Command Team and the MICROSAT design team, has been conducting a series of tests on the AO-16's subsystems since the July 27 on board computer reset. The tests conducted to date have provided the test team valuable information on the overall health of the spacecraft; subsystem performance degradation since launch; and have clarified some discrepancies noted in the telemetry channel assignments.

A capsule summary of the significant findings to date are:

1. The performance of the straight PSK transmitter (437.025 MHz) has degraded since launch. To provide better service to the user community, the team decided to switch transmitters and use the raised cosine transmitter (437.050 MHz) as AO-16's primary mission transmitter.

2. Six channels of temperature data in the telemetry stream have been mislabeled since launch. An update of the corrected telemetry decoding information will be published in the near future.

3. With the exception of the straight PSK transmitter, all of the systems on AO-16 are in good health and continue to perform as expected.

Details of the tests conducted and findings will be presented at the AMSAT-NA Symposium in Washington, D.C. during October 9-11th.

While the performance of these tests has delayed the loading of the new file server system software longer than expected, they are important to ensure the long term operation of the spacecraft and to gather data which will be used to enhance the performance of follow-on MICROSAT class spacecraft. The Command Team now estimates that testing will be completed in one to two weeks at which time loading of the new file server system software, which supports the directory broadcast feature, will commence.

AMSAT OPERATIONS NET SCHEDS

HR AMSAT NEWS SERVICE BULLETIN 228.04 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 15, 1992 BID: $ANS-228.04
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule

AMSAT Operations Nets are planned for the following times. Mode B nets are conducted on AO-13 on a downlink frequency of 145.950 MHz and the Mode J/L Nets on a downlink of 435.970 MHz.

Date UTC Mode Phs NCS Alt

22-Aug-92 1435 J 55 WA5ZIB WJ9F
29-Aug-92 1900 B 72 W9ODI N7NQM
12-Sep-92 1600 B 79 W5IU WA5ZIB

Guest commentators are planned for each Net. Join the Net if you have questions. In the unlikely event that either the Net Control Station (NCS) or the alternate do not call on frequency, any participant is invited to act as NCS.

Slow Scan Television on AO-13

SSTV planning sessions will follow the AMSAT Operations Nets. The Fall SSTV schedules will require input from all interested operators. Try all AMSAT Nets to set up impromptu schedules. Sample SSTV pictures are on AMSAT's landline BBS at (214) 394-7438 and on LUSAT-OSCAR-19 (LO-19).

AO-21 RUDAK SPEAKS RUSSIAN!

HR AMSAT NEWS SERVICE BULLETIN 228.05 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 15, 1992 BID: $ANS-228.05
TO ALL RADIO AMATEURS BT

AO-21/RS-14 RUDAK-2 Digital Speech Synthesizer Experiment Speaks Russian!

DB2OS reports that the new schedule for AO-21's transponder is the follow:

6 Minutes FM DSP-Repeater --> Uplink: 435.016 MHz
3 Minutes Digital VOICE in FM --> Downlink: 145.987 MHz
1 Minute 400 Bit/s PSK Telemetry

[Note that this means that AO-21 in the FM DSP-repeater mode for 6 minutes out of a 10 minute period, then 3 minutes of the 10 minutes and then finally 1 minute of 400 baud PSK telementry. This cycle is repeated for every 10 minute period every hour of the day.]

The RUDAK speech synthesizer experiment is speaking a Russian language message. N0ISE has translated the message to English as follows:

"RUDAK-2 RADIO SATELLITE 14 OPERATING NORMALLY. HELLO TO THOSE ON THE GROUND AND THE COSMONAUTS IN THE SPACE STATION MIR."

Those who copy this message and would like to receive a QSL card, please write down message in your language (or in Russian) and send your QSL card to RK3KP.

[The AMSAT News Service (ANS) would like to thank Gerhard (DG2CV), Peter (DB2OS), and Leo (UA3CR) for this bulletin item. Also, a special thanks goes to thank Tim White (N0ISE), second harmonic of WD0E, who is a Russian language major at Colorado University in Boulder, CO for his translation of the RUDAK Russian language message.]

AO-13 TRANSPONDER SCHEDULES

HR AMSAT NEWS SERVICE BULLETIN 228.06 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 15, 1992 BID: $ANS-228.06
TO ALL RADIO AMATEURS BT

G3RUH Provides Current & Future AO-13 Operating Schedules

On 1992 Aug 17 [Mon] the Sun angle will have fallen to 30 degrees (87% illumination), and the full B/JL/S AO-13 schedule will be implemented as previously announced:

L G3RUH/DB2OS/VK5AGR *** Future AO-13 Transponder Schedule ***
Mode-B : MA 0 to MA 40 ! from 1992 Aug 17 - Sep 21
Mode-S : MA 40 to MA 50 !<- S transponder; B trsp. is OFF!
Mode-LS : MA 50 to MA 55 !<- S beacon + L transponder
Mode-JL : MA 55 to MA 70 ! This schedule operates
Mode-B : MA 70 to MA 256 ! every orbit, every day.
Omnis : MA 160 to MA 10 ! Blon/Blat 150/0

Mode B users are reminded that at MA 40, the Mode B transponder will be heard to go OFF with a click. Although you will still hear the Mode B beacon, do not attempt to uplink as you will get no Mode B response; however you could interfere with Mode S. Mode B returns at MA 70.

Note too that this schedule operates every orbit, every day.

The next event will commence on 1992 Sep 21 [Mon] with a move to attitude 180/0 with a B/JL/S schedule. The schedule will be as follows:

M G3RUH/DB2OS/VK5AGR *** Future AO-13 Transponder Schedule ***
Mode-B : MA 0 to MA 130 ! from 1992 Sep 21 - Nov 23

```
Mode-S : MA 130 to MA 140 !<- S transponder; B trsp. is OFF!
Mode-LS : MA 140 to MA 145 !<- S beacon + L transponder
Mode-JL : MA 145 to MA 160 ! This schedule operates
Mode-B : MA 160 to MA 256 ! every orbit, every day.
Omnis : MA 235 to MA 30 ! Blon/Blat 180/0

> to avoid rebroadcasting access codes.

Now I said "block". That means filter out. I did not mean
"blank". To blank would be to detect DTMF on the input and shut down
the output to prevent DTMF from being broadcast. I am assuming Gary
meant blank. I would ask him via e-mail, but have never been able to
get e-mail to him.

What I mean is simply this: DTMF is audio band. If a device has
normal audio bandwidth, then it will pass DTMF fine. Anyone got an
argument with that? DTMF was designed by Bell Labs to do just that.

Oops! You're right of course. But the reason I overlooked those columns may be that their content is really predictable. Usually they're in the spirit of "rotten operating", The Old Man, Wouff Hong (sp?), and all that. A lively op-ed page would have some thoughtful critiques of ARRL, QST, demographics -- and an (at least somewhat) iconoclastic style. E.g. the famous piece from Fred. (Maybe W2NSD -10 db.)

QST -- you're not very pithy!

> I am interested in making my HT more useable in my car. I have
> thought about buying an antenna and then hooking it the antenna
> connector on the HT.

I've had this setup on my car for a long time. I prefer it to having a full blown rig, as it is very easy to slide the ht underneath the seats and out of sight.

> What I was wondering is how I can boost the power to say 25w.

There are a few commercially available units. I have an Alinco amp, that takes in 5 watts and puts out about 30. There are also units made by RF Concepts, Mirage, and probably others. Expect a price around $100.

> Does anyone have schematics or suggestions for a non-tube amp for the
> car?

In addition to the above comments, Ramsey puts out a kit, for about 50 bucks I understand, that you assemble yourself. I never heard any comments on its performance, ease of construction, etc.

QST and the Radio Amateur Handbook have a few schematics as well.

There are a lot of options on antennas. I'm using a Larson dual band (144 and 440 MHz) with very good results. Of course you will hear similar remarks about any other model you can think of. Prices for these are about $40-$50.

From: davros@ccwf.cc.utexas.edu
Message-ID: <77843@ut-emx.uucp>
Source record: 285628

Have you ever had the following problem with your PA-6 Yaesu DC converter and battery charger thingy? You know--the duhikis that you slide on the bottom of your FT-411/470 that lets you use 12 volts and charge your battery?

The way it is ... myself and a friend of mine, Dave, N5RUL (aggedor@ccwf.cc.utexas.edu) have similar problems with our PA-6's. The solder joints from the jack on the side of the unit to the circuit board seem solid enough ... but these things have some sort of intermittent problem. Mine is intermittently working, Dave's intermittently not. :) Maybe the jack is loose or something ... maybe just a problem?

So ... if you've had this problem, is there a solution? Like ... How can we fix it? Or should a new circuit just be done? (No one can figure out exactly what the darned thing does...) Or is there a way to make the connections etc. more secure so that we don't have this problem? With mine it's gotten to the point where, if you move the radio with the PA-6 on it and a cord plugged into it to an external battery, it goes out ... I really don't feel like buying a new one. :) Any help/suggestions welcome.

In rec.radio.amateur.misc, clemon@lemsys.UUCP (Craig Lemon VE3XCL) writes:

> Did you mean factory NEW when you said "new" or just new to you?

The radio was (is) factory new. I have spoken to Yaesu and they said that my radio should have the new parts. Indeed the IF frequencies correspond to those described in the mod documentation which Yaesu faxed to me. If the intermod is occuring in the front end, changing the IF frequencies should have little effect. The fax I received showed that they changed the first IF crystal filters (Vhf and Uhf), the second LO crystals, and two inductors (in the tanks of the VHF first mixer and first IF amplifier). That was it.

Well, perhaps I'm reaching here a bit, but it *IS* possible that they
are just going with what they can get. Interesting articles may not be
forthcoming because no one is cranking them out.

Now if someone wrote a really good Op-Ed piece, and it got refused by
QST for inexplicable reasons, then we would have some basis for
complaint.

N5QWL Reports On STS-47

It still looks good for a September 11 launch of STS-47. The folks
at Kennedy Space Center have overcome a number of problems, and
the orbiter Endeavour is set to roll out of the hanger in the next
day or so to be mated with the external tank and boosters.

Please pass the word especially to our friends in the Eastern hemisphere,
since that's when I'll be awake and doing most of the voice QSO's.
Packet should be strong over the US. As a reminder, we will operate
split.

Packet (Call sign W5RRR-1): 145.55 downlink, 144.70 uplink

Voice (Call signs N5QWL, 7L2NJY): 145.55 downlink,
uplink (except Europe): 144.95, 144.91, 144.97
uplink (Europe only): 144.80, 144.75, 144.70

2344. License Manuals -- Which're the Best?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-17 07:00:31 UTC
From: amb@CS.COLUMBIA.EDU
Message-ID: <9208170700.AA05680@shadow.cs.columbia.edu>
Source record: 285632

I'm looking for comments, opinions, and such on the various license manuals that are out there. All I've seen are the ARRL, Ameco, and Gordon West's, the latter two of which seem to use the same strategy (just listing the exam along with explanatory answers), whereas the ARRL explains it all in one lump (*much* less repetitious) in more depth. Each has it's attractiveness to me, and I'm wondering what kinds of experiences people have had with them, especially those who have used more than one...

Source record: 285634

One of our collaborators (a company called Ford) has recently built some kit
for the work we are doing. This includes a 486 based PC. It runs off the car
supply, but they said they had to go through a DC-DC converter (and much else)
to remove to 300 to 400 volt spikes present in a car electrical system! They
found that simply filtering did not work. The other problem was maintaining
stability. The board may be rated up to 14 volts, but is it rated down to 7?

BOX 88 MOSCOW. RW3AH is trying to stop false rumors that Box 88 has stopped working. The Russian Union of Amateurs Radio (RUAR) which operates the National QSL Bureau in Moscow, Russia, states "Box 88 continues and is successfully working". For more details UA6HZ President of RUAR can be contacted on the Round Table Net every Sunday on 14287 at 0600z.

ET, ETHIOPIA. Jacques, FDD1PJQ, will be in ET-land for 3 years. He is using the callsign ET3JR and will be active on 10, 15 and 20 meters. He is also supposed to show up on the 14256 DX Net sometimes. QSL via FD1OYK.

HA5BUS CARDS. According to Peter, HG5BFM, the S2/, EP/, and other HA5BUS QSL cards are ready at long last. A couple of radio amateur volunteers are constantly busy with filling in the cards. So please have patience. You will be receiving them soon.

HC8, GALAPAGOS ISLANDS. It has been reported that George, KB2VO, has canceled his trip to activate HD8VO. The reason is unknown at this time.

HL, SOUTH KOREA. Collin, N6PIC, will be active from an Air Force base in HL-land for the next year. His callsign will be HL9OO, and he will be using a Harris radio and a log periodic. He has been active on 20 meters SSB starting around 1200z. Check between 14180 and 14190 kHz. QSL to his home call.

KH8, AMERICAN SAMOA. Oliver, DF6MS, has been active from here and is signing KH8/DF6MA. His length of stay is unknown. He was heard on the 30 meter band starting around 1130z. He has also been heard on 14022 kHz around 1330z. QSL via DJ3QG.

R3A, "VIVA RUSSIA Festival". Special event station R3A, located at the Russian Parlament, will be on from August 19 to 23. There will be three different radio stations on each day, and each day the stations will be different. On August 19 - R19A/U19A/4L19A, on August 20 - R20A/U20A/4L20A, on August 21 - R21A/U21A/4L21A, on August 22 - R22A/U22A/4L22A and on August 23 - R23A/U23A/4L23A. The stations will be active on all bands including the WARC bands. There will be a "VIVI RUSSIA" festival award signed by Boris Yeltsin available. Listen for details.

S2, BANGLADESH. Reports are that the licenses for Jim Smith (VK9NS/S21ZA), Rudi (DK7PE/S21ZC) and Erik (WZ6C/S21ZB) were only good for one week. As a result, Erik refused to accept his license (that's why he was not heard) and he is waiting until a license can be issued for a longer term.

SU, EGYPT. Three stations were active this week from here. SU1AY was heard on 14243 kHz around 0030z, SU1HV on 21002 kHz around 1900z and SU1SK was heard on the 14256 DX net around 1800z. QSL SU1AY via OE6EEG. QSL SU1SK via SU1ER. QSL SU1HV via IS0LYN.

V5, NAMIBIA. Just before going to print, Baldur, DJ6SI, became active on 21025 kHz around 1730z. His length of stay is unknown. Baldur prefers CW and will probably be active on all bands.

XT, BURKINA FASO. An Austrian operator is now active from XT-land signing XT2DK. His length of stay is unknown. The station was heard on 14221 kHz around 2215z. QSL to OE3DKS.

XX9, MACAU. Tony, XX9GD, was active on 14185 kHz at 1145z. QSL to P.O. Box 1476, Macau.

160 METER ACTIVITY. (Heard August 14-15)
FK8CP 1838 kHz around 0954z
G3PQA 1830 kHz around 0036z
ON4UN 1832 kHz around 0333z
ON7TK 1833 kHz around 0022z
TU2MA 1832 kHz around 0310z
V29SW 1832 kHz around 0241z
VP8GAV 1832 kHz around 0350z

DXAC VOTE POSTPONED. The DXAC was to vote on a number of important topics August 24th, but the vote has now been postponed until September 28th. The reason for the rescheduled vote is because the CRRL representative had not received any correspondences in over one month. Information will be sent again to the CRRL representative so the vote can take place in September.
The DXAC has been asked by the ARRL Awards Committee to study and recommend an addition to the DXCC rules that addresses abuses in QSLing practices pertaining to individuals and DXpeditions. The DXAC is looking for input by the DX community world-wide on this subject. Please send

comments and suggestions to: DXAC, c/o ARRL, 225 Main Street, Newington, CT 06111.

DXCC TIDBITS..... Ron, WB3LHD, has received a letter from a DXCC Staff person stating the operation of 5X5WR/A was an unauthorized operation. Also the latest TDXB reports that a ban on amateur radio is still in affect in Uganda..... The DXCC still has not received documentation for the Tunisian operation by 7X5ST/3V.... 5R8JD is still no good for DXCC credit (waiting for proper doc's)..... QSLs for S2/WZ6C and S21NQ are currently not acceptable for DXCC....

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

Not at all. Quite easy actually. All of the repeaters I use block the
retransmission of DTMF quite effectively.

2349. Converting 49MHz toy radios.

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-17 12:27:24 UTC
From: pjml@swmis.nerc-swindon.ac.UK
Message-ID: <30316.9208171324@swmis.nsw.ac.uk>
Source record: 285638

Has anyone converted 49MHz radios to 6 meters successfully? It looks like a relatively trivial task to convert the types with crystal-controlled receivers. A pair of these things appropriately recrystalled could be just what i need for a short-haul (1/2 mile) 9600-baud packet link; 100 milliwatts is enough to cover the path reliably.

--G6WBJ-- Peter J.M. Lucas ! The problem lies not in the unanswered questions,
PJML@SWMIS.NSW.AC.UK ! but in the unquestioned answers' -J. Paul Sartre

>software, however.

Well 300 baud does seem slow to someone who uses the government's multi-million dollar internet. However, 300 baud was hot stuff on telephone lines 15 years ago. And unfortunately it's as fast as the FCC will allow on HF right now. There's no *technical* stopper preventing faster operation. It wouldn't use 200 Hz shift FSK however. If you want to talk about slow, the 45.5 baud AMTOR is slow, and can't even handle a full character set. It's persistent in the face of errors however, as is packet.

Today, the only practical use of HF is for robotic forwarding of Email. The performance is too low for any other use. The robot has greater patience than humans and will continue to try until the error free transmission is successful. This is "good enough" for the volume of mail currently in the system. It's not "good enough" for the various other proposed uses of packet.

There are techniques on the horizon that would dramatically improve HF thruput. Clover and Piccolo use multiple carriers to transmit bits in parallel. That speeds thruput while keeping individual symbol times long enough to prevent fading and noise bursts from corrupting them. Spread spectrum is another technique that promises high thruput in the face of noise and interference.

Direct FSK symbol encoding is second only to AFSK in being spectrally inefficient and error prone on a HF channel. PSK methods available today can push 9600 baud over good HF channels. But the rules prevent it.

The VHF/UHF systems *can* be much faster. We use 56 kilobaud links in our network. But as KA9Q and I have been discussing, multiple hops run into problems of long delay times. The AX25 protocol is not well suited to dealing with this without a supervisory transport protocol and considerable RAM buffering in the various switches.

IMHO, outside the local area, packet is useful only as a forwarding medium controlled by automatic equipment with the patience to deal with the large delays present in the system. The kind of speed and interactivity associated with the internet requires high speed landlines and intelligent routing and buffering. All of that costs a lot of money, and amateurs haven't shown an interest in setting up multi-million dollar dedicated linking systems of comparable performance.

Combination systems that use the internet for long haul transport exist, but they really contravene the spirit of amateur networking. Riding as they do on leased lines owned by government and industry, they don't form an *alternative* communications network capable of helping out in an emergency when the landlines are down. If using government leased lines is the only way we can do high performance networking as radio amateurs, then I think we shouldn't bother trying to do high performance networks. The government has already shown that they can build and support landline based high performance networks. If we go that route, then we're the same as a DXer trying to claim credit for a contact he made via AT&T.

Our own US government, in the form of the Smithsonian Institution, insisted that Langley, and not the Wrights, invented the first airplane for more than 45 years.

To this day, there's still a bit of resistance within the Smithsonian.

I substituted 4 standard 100 uF 450 volt caps for the 3 at
500. There is a slight but unnoticable drop in total capacitance.
You might measure your high voltage. It it stays under 1200 you
can use just 3 450s. Be sure to put the balancing resistors across
each capacitor. K9ALD.

Packet certainly isn't the Internet, but a lot of people in other countries, or for that matter, young people, people with non-technical professions and many others in the developed world *do* have access to ham radio.

Those of us with some experience have seen a lot of progress... When I first got into ham radio I made many interesting (to me) contacts with 5 words/minute Morse, and by the time I got up to 20 words/minute I realized it was true that, given all the abbreviations possible with Morse (the equivalent of modern digital compression techniques?) and all the non-informative time-wasting words that are heard in the usual voice radio contact, it was true what the old-timers said, that Morse can be a satisfying way of carrying on a conversation and transmitting useful information.

My first on-line experiences were with a 110 baud modem. It hurts now when I have to use 1200 instead of 2400 baud to connect to some systems, but back then 110 baud opened up wonderful possibilities for access to powerfal facilities, file transfer, and e-mail.

My first computer had 256 bytes of available memory which could be programmed only by switches that entered data in binary. I would *never* go back to such a system, but at the time it presented an enormous range of interesting, and, yes, even useful possibilities.

At a later stage that computer used cassette tape at 2400 baud for mass storage. It seemed OK at the time, but when I got a floppy disk I never wanted to go back. When I got a hard disk I never wanted to use floppies again. My Apple seemed pretty fast before I saw an XT, and that seemed fast enough until I got my 486...

The point I want to make is that at each level there are useful things that can be done. Let's not discourage those who don't have Internet access by denigrating packet radio. Packet is still useful for many purposes.

Just as with the comparison I made between efficient Morse and sloppy voice communication, it is worth keeping in mind that wider bandwidth and faster hardware doesn't always get the job done better. When I

graduated from a 256 byte to a 16 Kbyte computer it allowed me to write programs in BASIC rather than setting bits, but the programs actually executed more slowly. Much of the power of today's PCs and Macs is used to create easy-to-use graphic interfaces, but the programs that run in these environments are slowed because so many resources are being used to provide user convenience.

2358. CATV drop coax as Scanner Antenna Coax

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-17 13:42:15 UTC
From: wstef@hubcap.clemson.edu
Message-ID: <1992Aug17.134215.21911@hubcap.clemson.edu>
Source record: 285642

I just recently put up a Grove scanner antenna for my PRO-2006. For coax
I used about 75ft of CATV drop cable the exact type of which is unknown.
I think it might be some type of RG-6, maybe RG-6U. This coax has both an
solid shield around the foam insulator and braided shielding on top of that.
What is this stuff I have? Am I loosing a lot of signal due to impedance
mismatch (75 ohm coax vs 50 ohm scanner)?

The quality of received signals has increased greatly so I'm not complaining.
I just want to know if I am getting the most milage out of my $40 antenna.

OK an OZ4 is a voltage regulator tube. It works much like a zener diode
does today only at higher voltages. I will sink current from a power
source until the desired voltage is achieved. The more current it
has the brighter it glows. Zeners are very dull. They don't glow
until their power rating is exceeded.

> Pl. Enlighten me, Ok?

If the coax is properly matched, it doesn't matter what it's length is. There's no magic to quarterwave sections. If the line has a VSWR of other than 1:1, then *any* transmission line segment will act as a transmission line transformer. It happens that a quarterwave transmission line segment has a particularly useful transformation ratio, but it's not unique in acting as a transformer. In the mismatched case, the antenna load presents an impedance R+jX to the coax. This is transformed down the length of the coax to another value R'+jX'. Now it may be that a particular line length will, in a particular case, transform the R of the antenna to an R more to the liking of the radio at the other end. This can be useful. *But*, the jX will also change and this must be dealt with. If the radio has a variable output network, the reactance can be absorbed into the network and effectively "tuned out". Thus radio and antenna are happy and maximum power is transferred. But if the radio has a fixed tuned output network, the reactance will change the *tuning* of the output network in such a manner that the R value that the radio wishes to see will be different than 50 ohms. This can be bad or good. With the proper combination of complex load impedance and line length, it's possible that the reactance presented to the fix tuned network will be just the right amount and sign to *retune* the network to properly match the R' presented to the radio resulting in maximum power transfer. In this case *only* does line length matter. In all other cases, the jX just makes the match worse.

Note in case it isn't clear that the output network of a transmitter is itself a transformer made up of inductors and capacitors. It's job is to transform a nominal 50 ohm load impedance to the output impedance of the final amplifier's active device. In the case of a transistor final, this is usually only a few ohms, or even a fractional ohm in higher powered amplifiers. In the case of tube amplifiers, the active device output impedance is usually a few thousand ohms. The output network transforms this impedance to an idealized 50 ohms. 50 ohms is chosen because it's a convienent value of impedance for a coaxial cable. There's nothing magic about this number. Another impedance could equally well have been chosen.

An idealized quarterwave vertical antenna has a base impedance of 37.5 ohms. This isn't a match for 50 ohm cable either. So a matching network is part of the antenna to allow the impedance to be transformed to 50 ohms. Now either matching network, at the antenna or at the transmitter, can be tuned to match a different impedance by the addition of reactance of one sign or the other. When the transmission line is not matched, IE it has a VSWR of other than 1:1, it will present a value of reactance at the other end that depends on the length of the cable, the degree of mismatch, and the sign of the mismatch. This reactance will *retune* the matching network terminating the line to a different transformation ratio.

The interactions of the *system* can become quite complex. In the end, the only transformation that matters is the one from transmitter active device to antenna radiating element. That is, Rg must match Rr. If there are mismatches in between on the transmission line, they don't matter. They just become a part of the total transformer system. So it makes no difference if the VSWR on the transmission line is 1:1 or 7.38:1 or any other reasonable value, as long as the radiating load's impedance ultimately is transformed to the active device's impedance, either by happenstance of transmission line length or deliberate adjustment of matching component values.

Transmission line VSWR is particularly easy to measure, so you see a lot of these meters. But it's not necessarily the most important measurement of system performance. A distant field strength indicator is the most reliable indicator of good system performance. You shouldn't care what the transmission line VSWR is as long as you are putting the maximum possible field strength reading on the distant meter. *One* case where this will be true is when the antenna matching network transforms Rr to 50 ohms and the transmitter output network transforms this 50 ohms to the output impedance of the active device. In this case *only* will a VSWR of 1:1 coincide with maximum radiated signal. In other cases, a VSWR other than 1:1 may be *necessary* in order to achieve maximum power transfer.

2363. RCA VEETAC TCXOs Needed

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-17 14:30:07 UTC
From: dubner@hpspkla.spk.hp.com
Message-ID: <30690018@hpspkla.spk.hp.com>
Source record: 285652

Can anyone give me a pointer to a small quantity of "channel elements" (TCXOs) used in old RCA VEETAC Series UHF and VHF radios? A friend (Dave, WA7QKD) has a couple of RCA repeaters that have been removed from commercial service but they have no oscillators. He asked me to see what the notes community could scare up.

Dave would be most grateful and would be willing to reimburse costs or trade something from his fabulous junkbox. (In the past, his junkbox has yielded solar panels, tower, and gel-cell batteries -- speaking from my personal experience :-)

73,
Joe, K7JD

>
>Let's make sure we aren't talking apples and oranges here. Baudot and
>ASCII are bit encodings for *characters*, AMTOR uses the same encoding
>as Baudot.

Well, not really. True, the 7-bit AMTOR code maps one-for-one to Baudot,
but it's a different code. If you doubt it, try transmitting a SELCAL
using the 5-bit code and see how many stations link up to you! (Granted,
a nit.)

>Meanwhile, *compression* is done at the *text* level, not
>the character level. For example, I could zip a file and then uuencode
>the zip file. Then the file I would transmit would still be ASCII at

Here is my opinion... remember no matter what the situation you will always get over 100 complaints to every 1 compliment... people usually take the time to voice their opinions only when they feel they need to complain...too bad.

I like to contest.. but not seriously... so I really don't need the NCJ... but I sure do need the information posted in QST and like to see the results afterwards...

I will say it over and over again.. I love the magazine.. read each issue at least 2 times and have built a few small projects from it and hope to build some more.

I don't like to read about packet.. but who cares.. the articles are there if I decide to read about them.. can't think of any magazine for any sport or hobby where every article would appeal to every reader.. would have to be have a very narrow scope and very few pages.

I have only been in the hobby for about 1 year... but the ARRL sure has helped me get interested in new parts of the hobby and support the parts I am already interested in.

I suppose it depends on your sense of aethetics; myself, I find it hard to consider a design that doesn't work "elegant"... If "reliable" appears on the spec sheets, relays may well be "elegant" where dozens of EMI suppression components that won't protect the CMOS circuitry anyway would be just a badly-thought-out kludge.

>yes and no. For one thing, the ARRL is suppressing free trade, freedom of
>the press and free speech by denying these advertisers.

BUZZ! Wrong, but thanks for playing.

First of all, QST *has* advertised Antenna Wax :-). Second of all, to turn
the famous phrase on its side, the ARRL owns the press, so they have the
freedom[1]. The ARRL is doing absolutely NOTHING to prevent you from
buying from shady advertisers (or those too stingy to let the ARRL have a
freeby), and absolutely NOTHING to prevent these advertisers from conveying
their message to you -- all these advertisers have to do is buy a tape from
the FCC and they've got your address. (Though it would probably be cheaper
to buy a box of mailing labels from Buckmaster Publishing). The ARRL is under
absolutely NO obligation to run their advertisements in QST, however, no more
so than you are obligated to hold Klan rallies in your living room. If it
really bugs you that you can't read snake-oil advertisments in QST, there's
several other electronics mags (and a few all-advertisement electronics mags
as well) which ought to supply more than your Recommended Daily Allowance of
snake oil. Me, I fully support the ARRL's right to enhance the value of their
product (advertising space) by attempting to increase slightly the average
quality of products advertised.

Now, as long as I've got the editor open:

>League Membership
>When the ARRL puts its support behind or against a political issue, they
>will always quote the will of its membership as its guiding principal.
>In other words, they act as if we all had voted on the issues it
>addresses. Well, unfortunately, the "voice" that the ARRL hears is often
>the "squeaky wheel", which as always gets the most grease.

Have *you* ever bothered writing a letter? *I* have, and I wasn't even
particularly mad!

>I've never met a section manager or district chief, and don't even know
>who my local representatives are.

How can you say there aren't any of your favorite snake oil advertisements in QST if you can't even find the names and addresses of all the ARRL section managers which are printed in EACH AND EVERY ISSUE OF QST?

>If the ARRL wanted a truly representative vote on what really
>matters to their constituency, then they should spend about $1 per
>member to send out Business-Reply-Mail, postage prepaid, check-the-box
>bingo cards to each of the members soliciting their votes.

AHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAH! If you think a 1% letter-writing rate is low, you've obviously never TRIED the above scheme.

>And finally, the name QST is the epitome of hobby-jargonism.
>While the ARRL is considering changing their name, why not give
>the magazine a work over too? How about something like "The Journal
>of the Axxx", whatever Axxx eventually turns out to be?

A[AR]RL will just be another meaningless acronym to the general public. Clearly, the name of the magazine needs to be something like

Journal of the American Amateur Radio League, You Know,
Those Radio Geeks Who Waste Valuable TV-Watching Time To
Go Play With Radios When Everyone Knows That If There
Weren't This Keen Music Video On Right Now You Could Use
The Telephone To Contact Anyone's Answering Machine Anywhere
In The World, As If That Would Do Any Good, Since They're
Playing Super-Mario-Brothers And Can't Be Disturbed Until
They Die of Starvation.

Of course, having to use microfilm for the front-cover photograph might drive up the cost of the magazine a little.

[1] "Freedom of the press belongs to those who own the presses." A phrase sometimes used to denigrate the idea of freedom of the press by those who've forgotten that in the US, unlike much of the world, owning a press is *not* good for a long prison term or a short trip to a firing squad...

Check out the Obits page of your local newspaper, you'll probably conclude that the newspaper was delivered by UFOs... :-)

I suspect one especial reason that Silent Key listings are of interest to some hams is that there is a much higher probability that much of the general readership will have "met" the individual in question; in (say) the radio-controlled airplane hobby (just to pick on a random hobby), it would actually be necessary to have attended the same conference to meet someone on the other coast...

Something like the model of the ACM or the IEEE, where the basic membership gets a "core" magazine or two (though see comp.org.acm for current flaming on the quality of Communications of the ACM), and you optionally subscribe to different special interest groups. The disadvantage of that, however, is that it fails to encourage people to broaden their interests; with QST as it is, there's always the possibility that a technical ham will see a TV news report about an airplane crash and wonder if he or she would just stand around watching one uselessly, and might dimly remember a recent QST article about public service; or a public-service type might one day look at his or her radio and think "Gee, at least I know how to change the oil in my car, but I don't even know what kind of oil my HT uses! Gee, wasn't there an article about electronics in QST a couple of years ago...?"

I wonder how thin the "core" QST could get and still devote enough space to various factions to keep everyone reminded that there's more to ham radio than their own peculiar fascination? And, of course, how do you convince those who just *aren't* going to realize that to read QST anyway?

Maybe it is also a lack of really good publishable articles. I am
on the editorial review board of Communications Quarterly for
antenna articles and related measurements subjects.

It is a rarity to see an article that is technically correct and
does not attempt to refute or repeal basics like Ohm's Law,
Conservation of Energy, etc. I am not addressing such items as
spelling, grammar, and so forth; these are things any editor can fix.

I had one recently which attempted to tell prospective readers that
reflected power was lost power. There were equations to prove
it, too!

If your roof is all metal, you might have some unpleasant interactions --
or some pleasant interactions, it's impossible to tell without actually
trying it. If your roof is not all metal, it will almost certainly work
a darn sight better than the same dipole 10 feet above the ground.

Remember that if you have a sufficiently flexible Transmatch and a reasonably
low-loss feedline, the actual length of the dipole is unimportant (try to avoid
having the legs each be a half-wavelength on any band of interest, that will
be hard to match).

headrick@radar.nrl.navy.mil (James M. Headrick) writes:
>The basic article on this antenna was in the May 1964 IEEE Transactions on
>Antennas and Propagation, titled "The Bent Backfire Zigzag - A Vertically-
>Polarized Frequency Independent Antenna" by J. W. Greiser and P. E. Mayes.
>The LP Zigzag is briefly mentioned in Jasik's latest edition Antenna
>Handbook, but I do'nt know of any construction references.

It is also briefly discussed in the Proceedings of the IEEE for January 1992,
the Special Issue on Antennas; see pp. 105-107, in "Frequency-Independant
Antennas and Broad-Band Derivatives thereof", by P. E. Mayes.

Someone here said they modeled it with MININEC and got poor results. I have
a handy copy of NEC2 (the "real" thing); if someone can tell me how to model
this antenna with NEC2, I'll give it a whirl. The above mentioned article
gives an actual mathematical discussion of the antenna, though, and I'd be
personally suspicious of believing the results of a simulation of an
approximation in preference to either the math or the behavior of the real
thing.

I recall reading somewhere (in RF Design? I'll have to check) that the patent
owner has publically given permission for amateur radio operators to use the
invention for their own use without royalties. Very nice.

John, WB7EEL

That's good. And the impedance mismatch is no big deal. I've just put up another scanner antenna using the 3/4" hardline CATV coax. I built my own connectors out of 1/2" pipe-to-1/2" copper tubing fittings that screw right onto the aluminum coax shield. I cut a female-to-female N connector in half and soldered the center pin right onto the coax center lead. I sweat soldered the N connector housing to the copper tube fitting and screwed it onto the coax using NoAlOx on the threads.
I had an Austin Metropolitan tri-band mobile antenna that did not survive mobile use. This antenna is 3 concentric brass tubes like you buy at the hobby store. The widest and shortest is 1/4 wave length on 440, the next is 1/4 on 220, and the wire up the middle is 1/4 wave on 2 meters. I soldered it back together where it broke off at the bottom and mounted it directly on the end of the hardline by soldering a Larsen NMO brass base threaded ring onto the 1/2X1/2 copper tube fitting. I had brazed radials onto this fitting with different lengths for the different bands. They sloped down at a more extreme angle than the usual 45' to attempt a better match to 75 ohms. I then coated the whole antenna with liquid electrical tape. This is neat stuff but expensive. Available at your hardware store.
It works great mounted 60 feet up a nearby tree. The previous antenna was a FAA discone with ethernet cable. This antenna works much better on all ham and scanner bands.

2383. G5RV Look-alikes

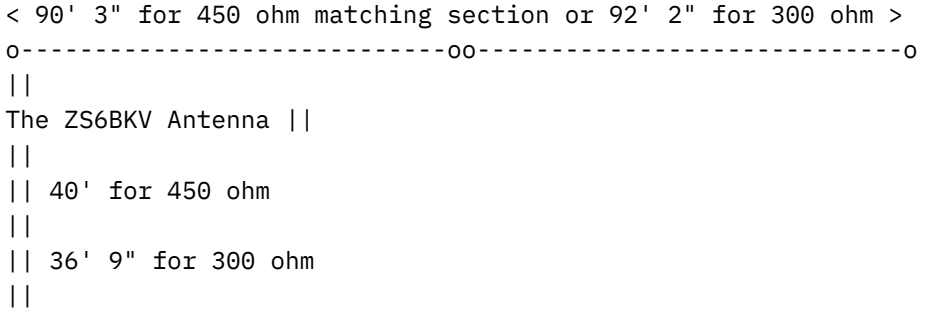
Newsgroup: rec.radio.amateur.misc
Date: 1992-08-17 17:15:14 UTC
From: edh@sqa.dsg.ti.com
Message-ID: <1992Aug17.171514.22457@axis.dsg.ti.com>
Source record: 285671

With all the questions concerning the "G5RV" type antennas, I thought it might be time for a repost of my review from early last year. I built and successfully ran the shortened version described below in the inverted-V configuration. Enjoy!

Multiband Wire Antennas
By Ed Humphries - N5RCK

The March 1991 issue of CQ Amateur Radio contains yet another discussion of multiband wire antennas. In his column "Radio FUNdamentals", Bill Orr, W6SAI writes about the original W9CXX multibander with its' complex copper tubing matching section. He then goes on to discuss the popular G5RV developed by L. Varney, which is widely built and commercially available. Orr points out the deficiencies of the G5RV: when built in the original design it delivers reasonable SWR on the 7, 14, and 24 MHz bands, but into a 75 ohm coax feedline that is awkward to load up on modern transceivers; when built with 50 ohm coax the SWR is poor on all bands, but it performs reasonably well when used with a "transmatch" antenna tuner.

The column skips over an intermediate antenna design discussed in the March 1986 issue of Ham Radio. Bill's column back then pointed out that W5ANB first proved you could successfully modify the G5RV, load it with 50 ohm coax and run without any antenna tuner. But the best design (so far HI) he discusses in both articles is the one by ZS6BKV. Brian Austin used computer modeling to help him design a 5 band tuner-less antenna. Orr's CQ column reprints the design using only the dimensions for a 300 ohm matching section (I presume TV flat lead qualifies). In his original column Orr also presented the figures for using 400 (handmade open-wire leads) or 450 ohm (ladder-line) as the matching section. Since 450 ohm ladder-line is somewhat stronger than the commonly available 300 ohm TV lead-in, I'm here giving both sets of figures so you can make your own choice.



||

At the end of the matching section Orr recommends a 1:1 balun; others would say that several loops of coax at the feedpoint will do as well to help keep rf off the feedline. The feedline to the transceiver is common 50 ohm coax; RG 58/U is fine for hf for most runs. This antenna should give low SWR on 7, 14, 18, and 24 MHz bands. At 28 MHz the SWR is really only good from 28.5 to 29.0. Tests showed the best SWR curves when the antenna was erected at about 42 feet above ground. When run as an inverted-V (90 degree) the resonant frequency came down 80 kHz for 14 MHz and 125 kHz for 24 and 28 MHz. The March '86 article printed SWR curves, and the March '91 article printed field patterns for all 5 covered bands.

|> more than one...

Two days ago I passed my Extra tests, so my study techniques do work, at least for me. For the element 4B test (Amateur Extra written) I used the study cards sold by VIS (from Mississippi.) Their package consists of double-sided cards. One side has the question and the multiple choices, the other side has the question and just the right answer (and perhaps some very brief explanation of it.) I believe there is a card for each question in the exam question pool.

Advantages of this system:
1. You can segregate the cards into piles, such as "Already know this", "Need some review" or "Virgin Territory".
2. Easy to study for just a few minutes at a time, anywhere.
3. No extraneous material.
4. A quick and easy way to pass the exam!

Disadvantages:
5. There is much repetition of single concepts; rephrased, or with different numbers to plug in to the proper algorithm.
6. The explantion is missing on some cards where it would be easier to learn the formula.
7. The system is designed for you to memorize the correct answers, perhaps with little or no understanding of theory or application of that info.

IMHO, this final point is potentially harmful. You could pass the test by rote memorization, even those question involving calculations.

BTW, I found the Extra test to be much easier than the Advanced test was, nine years ago. (I've been licensed for 27 years.) On the CW side, I used the Morseman Plus program on my PC, W1AW's practice sessions, and a few QSOs to get up to 20 wpm. I think the PC-based practice was most important.

I agree. You can have well written articles that entertain as well as
teach. I thought Cicara's stuff in Byte was excellent. His article on
a "Computer controlled wood stove" sparked my interest (no pun intended)
in home control projects. Lets bring back Carl and Jerry! Anyone
remember them? I started following their adventures in grade school and
learned a lot from the stories. Just my two cents worth.

I recently acquired an FT-101Z with the D upgrade (digital freq. counter display), and love it. I now would like to add to it and have the following questions:

Is there an anonymous FTP site which might have text files on modifications for this rig?

Is there anyone out there who has successfully added the WARC bands to it?

Thanks.

2388. Questions about G5RV

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-17 17:52:29 UTC
From: sbaker@umassmed.UMMED.EDU
Message-ID: <9208171748.AA03986@umassmed.UMMED.EDU>
Source record: 285667

I run a G5RV up about 35 feet in the middle. It loads up fine on 80,40,20,15 and 10 meters, and I have fairly good success on 20m dx. My signal reports are usually 4x or 53 and don't do as well in the pileups as I'ld like. I'm thinking of building a dual quad just for 20m but can't complain as I've got quite a few countries with the G5RV with a barebones FT-101Z and have good success on every band except 160m.

By the way, I do have a balun on mine, and use a tuner; I understand that I need neither of these with this rig and antenna (tube finals) but love to see that SWR drop. It gets below 1.3 on every band except 160m.

I don't really read, just skim through all this stuff. I think
if you want to use QSL QRZ etc on phone go for it. If you want
to make up silly names and use them instead that's OK too. If
you are an ex law enforcement person or CBer you might use the
10-4, 10-10 etc although you might get QRM'd.

However if you live in south Florida or watch "COPS" on TV you
may notice that the Miami Police Dept uses Q signals on their
voice radio.

Hmmm...

Cost of radio: $150
Cost of new xtals & shipping: $20 (approx)
Cost of endless hassle trying to
get it to work right: $???

Total: $170 +++++

Result: a two channel, xtal controlled HT for about the cost of a good
second-hand fully synthasized rig. To each his own, but it doesn't
strike me as all that good a deal.

> amateur radio sets?

All aircraft radios, without exception, are set up for carbon mics.
Many installations use dynamic mics with internal transistor amps
powered by the bias provided by the radio for the carbon mic. You
could use the aircraft mic on the Drake rig only if you provided a
source of power to the mic. Seems to me it would be much easier
just to get the right plug and use an ordinary mic; the usual sort
of mic (e.g., Shure 444) is *much* better for SSB, anyway. The
plugs can be had at any hamfest. 73...

>
> Does anyone know where the source for this project might be
> located? I can FTP.

I built the Super Keyer II from the pc board kit listed in the
handbook. It works like a charm and I like it a lot. The chip
comes pre-programmed, with the code already blown into
on-board prom. The whole deal, including chip, pc board, and
all external components, sells for around $50. I don't think
you could duplicate it for that price, especially if you have to
program the chip youself, and place any value at all on your time.
I did have occasion to call one of the authors listed in the original
QST article, and he was very helpful. If you are dead set on
programming the chip yourself, perhaps you can contact him
and see if he will send you a copy of the code.

The "standard" paddle these days seems to be the Bencher,
which sells for around $70. So if you like the one you
built for youself, you certainly have the right to
feel smug.

Good luck.

From what I gather from just a small amount read, it seems that Brian was
actually conducting a test to see if indeed a single composite posting was
workable. I don't know the results (I did get it) but I don't see any
reason to flame him for trying.

>Really, it's pretty simple for an individual to combine the part on their
>own. I don't see why you need to do this for them.

FAQ maintainers are already very busy. If someone has an idea they feel is
worth trying, I don't see why they can't give it a shot. What Brian might
has risked is flamage from systems administrators who might not like large
articles. But the total size is no more than the sum of the parts sent
separately, so what would it matter now?

>There is more involved then propagation on the net. When I go to download
>the FAQ to my PC at 2400 baud I like it in the multipart form, and this

>is being downloaded, it gets aborted and I have to start all over. So, I
>don't loose as much time restarting the download when I do it in parts, I
>only have to restart the part that was interrupted.

The "split" command on UNIX will let you split it up in the sizes you like,
and you won't have to edit out the redundant headers afterwards anyway.
It's available on every UNIX I have seen, and certainly NETCOM.

>>If the FAQ article can be successfully transported in a single large
>>posting, there is a net win in saved header bandwidth and user frustration
>>with having to assemble the multiple parts - or skip the message they've
>>already seen.

>Header bandwidth is pretty small, this isn't much of an argument. And it's
>not hard for anyone with minimal knowledge of newsreaders to assemble the
>parts, the news reader will do it for you.

How many different news readers do you have the time to read all the
documentation for to make such a broad statement?

Just how many sites with such and such a limit constitutes the least
common denominator. Yes I know that sites do have these limits.
They are certainly NOT limits of disk space, since the original
partitioned FAQ would take more space for all parts anyway.

When will we give them some incentive to come out of the dark ages?

Will they remove their 64K limit by the end of 1992? Maybe a compromise
would be to do that?

As I understand it, QST does not reject ads because of "poor quality"
products. Ads are rejected only if they make false claims. A good
example is the Maxcom "antenna tuner" which consists of basically
a large attenuator. (Sure enough, the SWR reads less than 1.5:1,
even with no antenna connected!) For those who really want the device,
they still advertise in 73.

Wait a minute... Two-way radios operate off car 12V systems all the time,
and I can assure you that they do not use 400V-rated components!

When I was designing radios at Drake (before they got out of the business)
a simple L/C filter was all the power conditioning required. And even
that was mostly there just to clean up ignition noise.

>no-code license was accepted, almost verbatim, by FCC.

Harry Dannals is a neighbour of mine. We are members of the same local
ARC (Albemarle Amateur Radio Club) and I've had the pleasure of elmering
him some in computers and such. He's got an account on my machine, I only
wish he'd use it.

I've talked to him quite a bit about the no-code license, which I have.
I've wanted to play with Amateur Radio since I was 10 years old, but
the code was always a barrier for me.

Anyways, I'm about to take my element 1A, and get my 5WPM code endorsement,
and I hope to get General before long so I can fully enjoy HF. I'd never
have done it (Morris Code) if not for the change in perspective, i.e. that
it is a opportunity instead of a complete requirement. It allowed me to get
a taste at being a Real Ham, and the opportunity for more.

I just got off the phone W/ Harry. I thought it would be nice to goad him
about getting online more, and he pleaded the usual; busy busy busy :)

He did want me to add that it was exactly his hope, and he thought that of
the other GCWA folks are well, that by creating a codeless entry level into

Amateur Radio that those folks would add to the hobby/science and find areas of interest to themselves, including Morse code...

Anyways, I'm not sure if I wanted to name drop, or give you something from the horse mouth (oh, he'll appreciate that) but there it is...

Enjoy Amateur Radio, I sure do...

2401. PVC Antenna - Beam

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-17 19:32:52 UTC

Help??

I recently built the portable vertical antenna from a recent CQ article. It is only 10 foot tall and only has 16 foot of wire on the mast and (2) 16 foot radials [which should make it a 1/4 wave lenght]. Somehow it works fine and I have had a lot of sucess taking it portable for QRP work on mountains, motels, my driveway, etc.

This month's issue has a beam version of the PVC antenna. Of course I am excited about the prospect of gain and directionality. The article has the antenna wound with a full wave lenght of wire (33 feet each half of the driven element). The article says something about the additional wire compensating for helically winding the elements.

I am puzzled for 2 reasons (I am relatively new at all this stuff, love to try new antennas... but I am learning by doing and reading at the same time)

1. how come there is such a descrepency between the wavelenths of wire used?

2. in the article on the beam the author built a driven element and then a director. All the articles and books show a 2 element beam to have a driven and reflector. What is the dif. in performance?

Thanks in advance for any help.

I (and VE3KMV) tried to modify the 5-channel FM model (TRC-503), which is
PLL synthesized. Problem is, the synthesizer "knows" too much, and the
VCO is potted in goop, so it's hard to retune.

The initial approach was to simply change out the 10.240 clock for one of
a higher frequency (10.680MHZ, as I recall). The problem is that the
10.240MHZ crystal is also used to provide an LO for the 2nd IF, so you
still need 10.240MHZ. Since the PLL "knows" too much, you can't just
retune the VCO and play with the divide ratio in the PLL.

It's almost like it was specifically designed *not* to be modifiable for
6M band. Sigh.

I never say QRN, I always say that I am being troubled by
atmospherics.

I spent much of my early ham years wondering what atmospherics where
until someone pointed out they meant static.

2410. 60Hz magnetic fields in your house

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-17 22:34:20 UTC
From: wa2ise@cbnewsb.cb.att.com
Message-ID: <1992Aug17.223420.25847@cbfsb.cb.att.com>
Source record: 285609
Cross-posted to: rec.radio.amateur.misc,sci.electronics

Was reading a late copy of IEEE Spectrum articles on the possible, but
undetermined, health hazards of 60Hz magnetic fields. Mostly from
powerlines. Article mentioned that one source of such fields are unbalanced
current flows in the house's safety grounds. I used a clip-around
current transformer and a DVM meter set to current mode, and measured
water pipes, powerline "BX" cables (armored shield and power wires all
at the same time, if balanced, should show zero current reading) and
the power wires feeding the house. First "calabrated" the measuring
equipment with a power cord feeding a 60W load. Split the cord so I
could measure only one of the 2 wires (So I would have an order of
magnitude understanding of the DVM readings). The house has an
underground conduit for the powerline from the power company, a
safety ground to the copper water pipe, and "BX" cable thruout the
house. Safety ground is connected to the powerline neutral at the
KW meter and runs to the water pipe where that enters from outside.
Well, I found about 1 to 2 amps of current comming from the power
company and about the same current going in the water pipe. (Note:
I'm guessing directions here, and guessing that I don't have the
water pipe and power company adding instead of balancing).
Safety ground has about .7 amp, and the fat "BX" cable feeding the
circuit breaker panel had about 1.2 amp. Found about 1/2 amp on some
water pipes near the furnace and water heater. Also found about an
amp on the water pipe above where the safety ground connects to it.
(Must be places in the house where water pipes touch the armored cables)
Currents changed somewhat randomly, and not usually corrolated with
our power demand. We may be acquiring current from the buried conduit,
and sending it into the water pipe (dirt in the ground does have
resistance). Or comming from another house.

The point of all this is there are sizeable unbalanced currents running
around all over the house. Is it a problem? As far as shock hazard
goes, no. And are the magnetic fields a problem? who knows...
You might be suprised to find such currents running around your house.
If you have a clip on current transformer (mine is a Fluke, and I used
a Beckman DVM) try measuring your water pipes!

>
But we do, Jim. How about:

Restricted housing developments built by builders who haven't
the slightest clue what amateur radio is, but they know the
places will sell if they include all sorts of convenants
designed to improve "aesthetics";

Consumer electronic manufacturers that refuse to build in decent
RFI protection 'cuz it hurts the bottom line;

Commercial interests that see gold in them thar ham freqs;

and so on.

What do all of the above have in common? Yep, you guessed it:
money! They've got it and we don't. What's worse, the average
ham doesn't even care about these threats until they directly
threaten his interests. What's that, you say? Maybe we should
have a national organization to combat these threats? Hmm...
sounds good to me...

>purposes.

When I first heard that packet radio was only 1200 baud I was taken
aback! However the first thing I saw were ads saying that you could upgrade
your packet modem to 2400 baud. As the prices of packet modems start
dropping down to resonable levels you will see higher speed modems
becoming more common. In the next 5 years 9600 will be close to the norm
and not 1200 baud. Packet radio reminds me of the first years of computer
communications. Overpriced slow speed modems, no real standards etc...
Right now here in the Bay Area there is just now a 9600 baud link being
put in to speed mail forwarding through the Bay Area. For some reason
1200 baud is the standard and not 2400 baud. 1200 baud was dropped as a
standard years ago in the computer world. Is there any reason why 2400
baud is not the standard now? Part of the problem is none of the companies
are selling a 2400 baud TNC for close to the same price as a 1200 baud.
The 2400 baud chip set has been out there for quite a while so it isn't
like it's brand new technology. Interesting question here, is ham radio
technology driven at all?

Jeff

Apologies if this is a stupid question, but I've read through the
Handbook and the Operating Manual, and can't find a clear answer:

How do I call CQ (or listen for and answer one) on HF Amtor?

I hear lots of very clear signals, that I can LISten to, but I've
never seen a CQ or one being answered. I've got an MFJ 1278 and
several varieties of terminal programs from XTALK to LANLINK2.0,
but I can't for the life of me figure out how to start!

Thanks!,

>(gee maybe I ought to write up such an article and submit it...)

I spent some of my formative years not 12 miles away from the
very shore where King Canute (Knud) showed his sycophantic courtiers
that he was not omnipotant.

So, what has the fact that Canute shamed a few toadies have to
do with a poor command of the english languange?

To explain the above to those not familiar with the history of
the Danish Kings of England: The courtiers of King Knud told him that he
was a great and powerful man, that he could even command the tides. So
to show that these toadies were full of crap, he sat on the foreshore
at Bosham (Sussex) and commanded the flowing tide to hold. Of course it
didn't and he got pretty wet.

Followers of singlehanded sailing will be familiar with Bosham
which is often known as Chichester harbour. I lived in Selsey Bill,
home of many loonies, including Patrick Moore the loonie astronomer and
Brian Rix the comedian who kept losing his trousers.

Well, I think that what Brian is trying to do is find out now is how many
of us prefer the way he posts the FAQ verses the way the FAQ coordinators
post it. This has been an ongoing fued so to speak between him and some
of the coordinators. I'm glad he's taking a pole, and I'm just voicing
my opposition to his REposting and that I prefer the multiple part posting.

That's true, except split doesn't care about the content or headers of the files it splits. I like to print them out with the subject headers at the top of the first page. Since the original multi-part posting are already split in such a way, all I need to do is download and print.

Which is why magazine publishers that want folks to be able to find them
have a consistent masthead on the top two-three inches so that regular
readers can find the magazine in an unkempt rack.

Albert Einstein, when asked to describe radio, replied: "You see, wire
telegraph is a kind of a very, very long cat. You pull his tail in New
York and his head is meowing in Los Angeles. Do you understand this?
And radio operates exactly the same way: you send signals here, they
receive them there. The only difference is that there is no cat."

Well 10-4 good buddy! I must have been sleeping when they changed the basis and purpose of amateur radio. Sadly it seems you are right, however. A large number of "amateurs" seem to have little technical skill and little desire to learn.

2422. ARRL KUDOS

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-18 11:49:27 UTC
From: jkeller@pica.army.mil
Message-ID: <9208180741.aa11242@COR5.PICA.ARMY.MIL>
Source record: 285610

I would like to echo Jeff, AC4HF, in his compliments to QST and the folks at the ARRL who do such a great job with it every month. I've had lots of hobbies over the past 40 years, have belonged to lots of groups with lots of journals.....there is no question that the ARRL is right up there with the very best of leadership organizations, nor any doubt in MY mind that QST can hold it's own against ANY group's journal. That's MY opinion, and it doesn't mean there isn't room for improvement....but most of the folks at ARRL are constantly looking for ways to improve its representation of amateur interests. Look at Ed Hare, for example....just on this newsgroup alone....there aren't too many that contribute more or keep a cooler head despite some pretty caustic remarks. Look at the postings here from Luck Hurder, and from Jim Kearman. Mostly very thoughtful, USEFUL information.

The mix of articles in QST is dependent on what they have to choose from. I've always had my suggestions on that mix received gratefully....if I were making those selections, I'd appreciate all the member input I could get....that's the impression I've gotten from every ARRL staffer I've met, that they are really HUNGRY for input from the members and from potential members. Now, I've seen comments here that seem to imply that there's some "elitist" attitude conveyed by the fact that most ARRL folks wear SUITS to Hamfests and other activities. While I'm sure there are exceptions here and there, MY impression is that (a) it makes the ARRL folks recognizable, (b) it says they take their work seriously, and (c) it says they have respect for their organization and the people they represent (the membership).

I know that the "critics" are more vocal and visible in any group, but its also good to have some POSITIVE input. I am certain I have lots of company in my feeling that without the ARRL we probably wouldn't have as many priveleges or band space. And QST over the years has offered more and better features for ALL the diverse interests of the hobby than any other publication. Proof of all this? History, of course!! ARRL and QST are still around, still going strong after all these years!! They must be doing a LOT that's right.....

(an unabashed fan.....Jerry, K1MER)

TO ALL RADIO AMATEURS

SB QST ARL ARLB074
ARLB074 NEW SATELLITE

AMATEUR RADIO'S NEWEST SATELLITE IS IN ORBIT. KITSAT-OSCAR 23
LIFTED OFF FROM KOUROU, FRENCH GUIANA ON AUGUST 10TH ABOARD AN
ARIANE 42P ROCKET AND WAS SUCCESSFULLY DEPLOYED 30 MINUTES LATER.

GROUND CONTROL STATIONS ARE TESTING THE SATELLITE'S SYSTEMS AND
UPLOADING SOFTWARE, AND CONTROLLERS REPORT THAT THE SATELLITE SHOULD
BE READY FOR USE IN A FEW WEEKS. KITSAT-OSCAR 23 IS VERY SIMILAR IN
FUNCTION TO UOSAT-OSCAR 22. IT WILL PROVIDE PACKET
STORE-AND-FORWARD CAPABILITY AT 9600 BITS PER SECOND, ENHANCING
WORLDWIDE PACKET COMMUNICATIONS.

THE SATELLITE ALSO FEATURES TWO CCD VIDEO CAMERAS, ONE OF WHICH WILL
OFFER CLOSE-UP VIEWS OF THE EARTH. CAMERA IMAGES WILL BE STORED AS
DATA FILES FOR DOWNLOADING AND DISPLAY.

KITSAT-OSCAR 23 FREQUENCIES ARE: UPLINK, 145.850 MHZ AND 145.900
MHZ, AND DOWNLINK, 435.175 MHZ.

W1AW WILL TRANSMIT KITSAT-OCCAR 23 ORBITAL ELEMENTS AND ADDITIONAL
INFORMATION AS IT BECOMES AVAILABLE.

2428. GAP Voyager DX IV: any experience?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-18 13:58:59 UTC
From: rdewan@casbah.acns.nwu.edu
Message-ID: <1992Aug18.135859.5752@news.acns.nwu.edu>
Source record: 285616

I have been reading about the GAP Voyager DX-IV. It is a mid fed
vertical for 160m, 80m, 40m and 20m bands. It is 45' tall with a
8' dia. top hat for an electrical length of 64'. It has three 57'
counterpoise radials at the base.

Does any one one on the net have any experience with this antenna?
How does it perform on 40 and 80m? I am interested in DX and contest
performance.

My guess is that its performance on 40m and 80m is similar to that
of the Challenger DX-VI (which is half the electrical size of the
Voyager) on 20 and 40m respectively. Any experience with
this one?

In the 73 review of the GAP Challenger, the reviewer mentions that
the GAP was 1 s-unit down from a monoband QJR antenna designed by
Ted Hart, W5QJR. What is a monoband QJR antenna?
Any comments would be appreciated.

|>teaches copying CW by WORDS, rather than characters. Is anybody
|>familiar with it? How good is it?
|>

Those are the QSO Master(tm) tapes. They're not bad. They're not for learning code to pass the test -- rather they're for learning "QSO code." They consist of common abbrieviations and phrases repeated over and over and over and over....

At first, I didn't think it was that great because if you catch part of a phrase, you know what the rest of it is going to be, but after listening in the car for a few days I realized that's the point. Most QSOs are very stylized and if you get used to the sound of 73 ES CUL OM you don't have to decode the letters. Even if they don't send exactly those characters, the common ones drip into your unconscious and you only "hear" the ones that don't fit the pattern. It's really helped in my QSO confidence.

On the other hand, while any code work helps, these tapes are not oriented toward the exams or, say, traffic handling where the content is more free-form.

harp@bnr.ca (Alan Harp) writes:
>I don't really read, just skim through all this stuff. I think
>if you want to use QSL QRZ etc on phone go for it.

Actually, having already opined that most Q signals are silly on phone, it occurs to me that "QRZ" is not only shorter than "who is calling me", it (a) is possibly easier to understand for someone who doesn't speak English, and (b) connotes something, in its typical usage, that "who is calling me" doesn't; a DX station who says "QRZ" after an exchange isn't really asking "who is calling me", but the more obvious "Next?" might get lost in the QRM :-).

At least in the days when CW ruled the Earth :-), people probably used Q signals on phone because they got used to associating the Q signal with the specific meanings that were useful in radio; it probably persists because of a combination of clubbiness and habit. On the other hand, I've never heard someone substitute "kay" for "over" on phone... :-)

>However if you live in south Florida or watch "COPS" on TV you
>may notice that the Miami Police Dept uses Q signals on their
>voice radio.

Do they use the official set, or do they have their own? Is the FBI going to impound my ARRL Handbook as a reference for criminals? (What is the official Q-signal for "There is a nutcase with a gun at the McDonalds at ..." :-)

2436. Re: FAQ - do you prefer the long form or the short form

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-18 16:02:12 UTC
From: brian@ucsd.edu
Message-ID: <16r6u4INN56e@network.ucsd.edu>
Source record: 285625

In article <1c0m#zp.mont@netcom.com> mont@netcom.com (Mont Pierce) writes:
>No. According to on[sic] of the FAQ coordinators (I don't remember his name)
>Brian has been doing this for some time even though they asked him not to.

Nope, I've done it exactly twice in the last two years. None before that.

>I think I would also be upset if I was trying to provide a service and
>someone took all my work, reformated[sic] it and reposted it!

Hmmph. Concatenating the parts together and removing the transport
headers is hardly 'reformating'. Don't exaggerate.

>Well, I think that what Brian is trying to do is find out now is how many
>of us prefer the way he posts the FAQ verses the way the FAQ coordinators
>post it. This has been an ongoing fued[sic] so to speak between him and some
>of the coordinators. I'm glad he's taking a pole[sic], and I'm just voicing
>my opposition to his REposting and that I prefer the multiple part posting.

But it's not a feud, as we're discussing it privately. The poll
has, in general, met with a great deal of apathy. The dozen or so
responses I've received don't seem to indicate a great preference one
way or another. I've no intention of continuing to post the FAQ; I'm
just trying to convince the people who ARE posting it to change the way
they do it a bit.

Understand this: the info-hams mailing list and its associated newsgroups
(fa.info-hams, later net.ham-radio, now rec.radio.amateur.misc) have
been around a long time - the mailing list, for more than a decade.
When this 'FAQ' stuff started getting rolling a few years back, a few
newcomers to the net thought it would be a good idea, and began
assembling the postings. Not a bad idea.

Initially, the FAQs began being posted from a site with a seriously broken
piece of Usenet software, so they were made small enough to endure the
faulty posting software there. Later, they moved to another site which
does NOT have broken posting software, yet the postings have continued
in tiny pieces. This, and the frequency with which they are posted, are
what I'm challenging.

[The idea of a FAQ is to answer frequently asked questions. It's not
supposed to be a general factotum; it's counterproductive when the size
and frequency of the FAQ posting exceed the bandwidth of the questions
it's supposedly replacing. We could SEPARATELY debate whether that
point has yet been reached or not.]

>Look, ALL, I repeat ALL news readers have a save option. Try it, you'll
>like it.

For technical reasons having to do with Usenet transport mechanisms, it's often the case that postings arrive out of order. This can be a minor pain for people with advanced newsreaders, and a major one for those with primitive ones. For example, it's not too much of a pain to use rn (the most common newsreader on Usenet) to save the articles to discrete files (e.g., f.01, f.02, f.03, f.04) and then exit or suspend it and use 'more' to read them. Kinda defeats the purpose of the newsreader, eh?

For people who read the traffic in this group via the associated mailing list digest (info-hams), it's even more of a pain, since the parts have to first be stripped out of the digests and then reassembled. Since digests are sent when they exceed 32k to accomodate older mailers (primarily on MILNET sites), the FAQ postings are guaranteed to be split across multiple digests, which themselves are often received out of order.

There were, at one time, some small number of sites on Usenet who had limitations on the size of articles they could accept - generally based on a 64k memory partition size in PDP-11s. There were also some sites running the 'notes' software who couldn't store articles that large.

I'll wager there are damn few PDP-11s on the net nowadays, and 'notes' handles 64k+ articles just fine now. Standard C and B news batching is typically 100K batches, sometimes larger if the link is all via highspeed modems.

The FAQ postings together make up about 90kb nowadays, if you remove the additional 4k or so of redundant Usenet transport headers and concatenate them together. My experience shows that isn't too large to post as one article, but even if you wanted to play extra-safe (can't have them PDP-11's losing out on your wisdom, eh?), the FAQ could be broken into just two pieces. It surely doesn't need to be 6 parts long!

(BTW, not ONE person has been able to provide the name or describe a single known site that couldn't handle the large posting - best anyone could come up with was "I'm told that certain ones can't" or some equivalent legend.)

>Well, Brian ASKed for our opinions. My comments were in response to his
>request, not to flame him.

I'll just chalk it up to your language skills and turn the other cheek, rather than thinking you were indeed flaming.

2438. Sexist Statement

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-10 00:48:17 UTC
From: POLS0@AIS.UCLA.EDU
Message-ID: <9209101447.AA04093@ucsd.edu>
Source record: 285528

I really wasn't going to get into this--I have very little
sympathy for "politically correct" language. But being a
female in a hobby that is predominantly male, I find many
humorous situations and there is nothing I like better than
a good story. As President of the San Fernando Valley ARC,
I have put a number into our club newsletter.

I remember one time when I working Europeans during one
of the contests and a ham from Belgium wanted to say
something complementary (at least I took it as a complement)
and he told me that I had "a great signal for a YL."

My daughter (who is a ham) was on the committee to plan a
ham convention in the Bay area. She listened to the discussion
of the plans for the "spouses' program" and "innocently" commented
that she didn't think her husband (who is not a ham) would be
very interested in that. (He took care of the kids so she
could enjoy the sessions.)

Once when I was making a cw contact, I answered a station with
my call and he replied "thanks, OM for coming back to me" and
when I said that my name was Linda, his next question was
"Are you married?"

And once, when we were asked to put up a display on ham radio
as part of an emergency preparedness exhibit at our church,
someone looking at the display of equipment asked me if that
was my husband's keyer. I replied that it was mine (it was
an anniversary present one year), but that I let him use
it whenever he wanted. I guess I shouldn't have said that--
but he did come to a class we taught and now has his technician
license.

I love the hobby and the people we've met though it. I refuse
to take myself (or anyone else) too seriously and maybe I don't
recognize when I'm being put down but I don't think it happens
very often and if it does I don't worry about it. I certainly
don't take offense. (By the way, I also cook, sew, knit, quilt,
etc.)

Most mechanics seem to think that setting a battery on wood is a Good
Idea; among other things, it absorbs the shock when setting it down, and
it gives a way to get your fingers under it when you go to pick it back
up...

Most amateurs can't properly put a PL-259 on a cable anyway... BNCs are
MUCH easier (and have the same power rating as 259s!)

> anyone know what the real frequency is?

Anyone who copied DOVE on a regular basis during the Polar Ski Trek a couple of years ago learned firsthand about Doppler shift and FM. It doesn't matter what the actual transmit frequency is, since the only time the receiver is going to see that frequency is when the satellite is at the point of closest approach.

In practice, clearest reception may occur 10 KHz from the published frequency.

Still not convinced? Tune in your favorite repeater and then tune your receiver up or down 5 KHz... you will likely be able to copy it just fine.

I have a Standard 528 (2m/440) that uses a positive sleeve on the power cord. I've used this radio with a Larsen NMO-K mount antenna (3/4 inch hole mount... VERY well grounded!) with no problems whatsoever.

I use a fused lighter plug, however... and carry a box of fuses.

2444. Heathkit HW-8 or HW-9 wanted

At the recent ARRL National Bean Feast I was wandering the
displays. Over in a corner was Atlas Radio. Yes, the people who gave
you all transistorised no tune radios before the Japanese, are back.

They have a new model, the 310. It has the following features:

Freqs (standard from factory) 3.5-4.0, 7.0-7.5, 14.0-14.5,
21.0-21.5, 28.0-28.5, 28.5-29.0. Other freqs (i.e. WARC, MARS, CAP,
Marine) available with field Xtal changes.

Power out 150 W SSB, 120 W Morris, 80 W Packet, AMTOR.

Digital Freq display - analogue dial for backup.

Break-in Morris

USB/LSB

RIT

Internal Speaker

Switchable Xtal RX filters 2.7, 1.8, 0.6 Khz.

Power 12-14 V 1 Amp RX, 22 Amps TX (Average on SSB 7 Amps)

Size 8.5 X 3.2 X 8.4

Price $795.00

First Delivery November 1992

Call (619) 944-9622

While I was looking the radio over, the Pres' of AES was trying
to set up a deal to sell them through their stores. But will be
available out of the factory in Cardiff California.

In rec.radio.amateur.misc, d38987@proteus.pnl.GOV writes:

>I have heard that there is information available from ARRL on
>installing 2-meter and other transceivers in Toyotas. Can anyone
>tell me how to get the information.

Ron,

Send me your email address and a specific request for our "Auto RFI" package and the "Toyota File." I will send them out to you.

Unfortunately, the "Toyota File" is more about how one cannot install a transmitter in a Toyota. Toyota has stood firm -- they do not recommend that one install a transmitter in their cars and will not cover any resultant "damage" under warantee.

Just to keep our regular readers posted (all puns intended), we are slowly hearing from auto manufacturers. Just over two months ago we sent all major auto manufacturers a letter, asking them what their EMC policies are, what service bulletins they may have about automotive interference problems, and who at their company should be contacted to resolve any problems that can't be resolved at the dealer level.

So far we have heard from about 40% of them (Toyota hasn't responded.) I believe that some of the delay is that we told them we would make the information public -- the answer probably must be reviewed by their Legal, Public Relations and Marketing departments. :-). However, two+ months is long enough -- I just sent out follow-up letters to the holdouts, pointing out that I did not wish to have our published summary say that we had sent them two letters and did not receive a reply.

When we have received all we are gonna' get, I will put together a summary, for possible publication in QST (or other TBD means of informing our members. In the meantime, if someone is having a specific problem with auto EMI, or is just about to buy a car and would like to know what that manufacturer had to say, drop me an email or letter with the details (include your postal address.) I will see how I can help. I will be on vacation (and at the ARRL Roanoke Division Convention in VA Beach. Stop by the League booth to say hello or flame me in person. :-) from 9/14 thru 9/21. I will probably answer you after that.

That's it for now. I will keep usenet (and others) posted with further developments. 73 from ARRL HQ, Ed

If you haven't already, I'd suggest you pick up a copy of the ARRL's
"ARRL Radio Buyer's Sourcebook". (ISBN 0-87259-345-2. ARRL # 3452, $15.00)
It's a nice collection of QST reviews which, IMHO, is a decent way of
becoming familiar with the features, performance, etc.

Certainly owner opinion counts very highly, so I hope you get some
comments here on the net as well. I too am in the market for used
HF rig, and I've decided the best thing to do is do a lot of reading
beforehand. Good luck!

A "U" on the display means that the PLL is unlocked. Thus, you cannot
transmit or receive on the set frequency.

There is often no real pattern of where the PLL will be locked or not, at
least from my experience with my 2SAT.

Good luck,
Todd N0NUM

I keep thinking that what the market needs is a HF rig for $400. I don't need all the bell and whistles that the overpriced HF rigs have. I am using a old Swan 700CX with excellent results. What I would like to see is a basic rig with 2 VFO's, a couple of memories and over 100 watts output. Also with a built in power supply. There is a real hole in the market waiting to be filled by a rig like this.

73!

>>
>Why was 145.987 chosen, since only some Base and older FM units are able to
>dial this frequency?

>Steve KA0VYB

The above frequencies are correct for the AO-21 FM repeater. As for why 145.987 was chosen rather than a coventional FM frequency is really not even an issue. If you play with the satellites you know that the doppler shift causes a constant change in frequency on the receive end. This is especially true with the microsats which are in a low earth orbit and move very quickly. Therefore, on a typical pass the downlink can run from 145.990 to 145.985. I usually set my ht on 145.990 for the first 3/4 of the pass and then tune down to 145.985.

AO-21 is an experimntal spacecraft. FM is not its only mode and not its primary function. It has also been used for digital experiments and currently shares a 10 minute cycle with the FM repeater, Digital voice talker, and telemetry. The telemetry is not in FM mode.

I am by no means a satellite expert but hope this might clear up some questions about the function of AO-21 and its abilities. I don't have any 440 FM gear so haven't been able to uplink to it yet but I receive here all the time with no problems and have heard more than a few people on with just standard dualband mobile radios.

2458. ACSB repeater in Los Angeles

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-10 18:08:19 UTC
From: Don_R._Moberly.El_Segundo@xerox.COM
Message-ID: <"10-Sep-92.11:07:05".*.Don_R._Moberly.El_Segundo@Xerox.com>
Source record: 285539

I received this note from Jim Steffen KC6A. I would like to Pass it on with my Thanks for all of Jims Kind words.
It serves to Illistrate that people can use the repeater with very little cost or effort if they all ready have a SSB 2 meter rig.

{
From: James Steffen KC6A.
I was excited to hear someone has taken this bold first step in bringing some new technology to our overcrowded VHF bands here, so I rushed home last night to listen to this repeater and try it out. I connected an audio oscillator to the microphone input through a resistor (10k or so) and tuned it in. The receive freq is about 144.893 MHz usb and the input is about 145.493 MHz usb. I immediately worked Carl, AB6FC and Don, WB6LFC, and later I worked Dave, WA6CGR after telling him how to get on it.

This technology is exciting because it works in a 5 khz channel compared to the current 20 khz channels. This would allow 4 times the number of channels in the same spectrum that we currently have! Future success in this wil require people like Don and Carl making the commitment to put something on the air and experiment with it. Since this is a new technology (for hams) it is not fully compatible with current ham equipment. ACSB is basically an SSB radio with some special processing stuff that allows it to perform with many of the advantages of fm. Both Don and Carl have "real " ACSB radios and can enjoy its full benifits. Using a standard SSB radio with a pilot tone injected via an audio oscillator will allow you to get started but will not have the quality of true ACSB, so it should not be judged by just listening to it with an SSB radio! Audio from the repeater is highly compressed but completely intelligable and a little of the 3.1khz pilot tone can be heard.

I happen to have a box I built years ago with the audio compressor /decompressor and was able to hook it up to my radio. Don said it made the audio sound better. They want to explore the feasibility of using a little add on circuit outside the radio that will do the processing, but unfortunately, most SSB radios do not pass the 3.1khz pilot tone very well which is essential in making the system perform well. Despite this drawback, it is useable as is with a normal SSB radio and an audio oscillator. I want to congratulate Don and Carl for their efforts in making this bold new step and I hope others will join them in experimenting with it.

73
Jim, KC6A }

Thanks Jim,
73

I can imagine special cases where 9913 might make sense at HF. Say your antenna is located 1000 feet from the transmitter (1000 ft tower?). Then the 9913 would make a 3 dB difference. That can be important in a pileup.

(Actually, in that case, I think I would use open-wire feed or TV twin lead and figure out how to match it at both ends.)

I found the fm repeater at 145.987, +-or - 3khz for doppler.... maybe this is
why they put it between two channels. The simplest rigs will be using vertical
antennae, with more pronounced doppler shift (closer to the horizon). I hear
the beacon around 145.820 when it fades in.

>not an unlikely combination, I think. Unfortunately when I try to
>use the microphone I get immediate reports of RF in the shack. This
>doesn't happen with the hand-held microphone or with the Heil headset
>(which is what I use most of the time anyway - it's great).

Two possibilities:

I assume by "RF in the shack" you mean you beg "bit" with RF whenever
you touch the mic when transmitting.

There are two possible causes:

The antenna is too close to the shack, so the wiring between equipment
is picking up RF. The solution is obvious.

The other possibility is that RF current is flowing on the outside
of the coax shield. This could be due to an unbalanced antenna or
to direct pickup, due to the coax being in the RF field of the antenna.
A balun might fix the former problem. Running the coax away from
the antenna at right angles to the radiating element might fix the
later.

One general-purpose solution is to connect a quarter-wave wire to
the chassis of the transmiter. Use one wire for each band where
you have a problem. This worked for me even when I was using an
end-fed longwire into a tuner. (Talk about an unbalanced antenna!)

2466. Using WWV to set a digital clock?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-10 19:21:22 UTC
From: thorn@wam.umd.edu
Message-ID: <1992Sep10.192122.12370@wam.umd.edu>
Source record: 285542
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave

Does anyone on the net know of any electronic kits that can decode
the WWV signal to use for setting a digital clock? HeathKit used
to have a clock that did this. It would set itself using the strongest
signal (2.5, 5, 10, 15 and 20Khz) coming from WWV by BCD codes.
Are there any vendors that sell (cheap?) clocks that use the WWV
codes for calibration?

Thanks in advance. --Greg thorn@wam.umd.edu

I purchased a Kenwood TS-850S with built in antenna tuner a little over a year ago and I love it. The receiver is great and I get nothing but good comments on the sound of the audio on transmit. Although like most all of the radios on the market today it has some bells and whistles that I'll never use. But it also has a lot of features that I didn't think I'd care about at the time I bought it that I wouldn't do without now. As far as service goes...the mic that came with the radio didn't work right from day one (problem with the switch...it would not pop back out when you let your finger off it...no big deal but it wasn't right) so I called the service number that HRO gave me. A very nice person took my phone number and said that someone would call me back when they got time. Within 10 minutes (ok maybe 15) a person called me back...I told them the problem...they said no problem...3 days later I had a new mic in my hands that worked perfectly along with a note saying I could just keep the other mic. Now granted this wasn't a big problem but I don't know what they could have done to do a better job taking care of the problem. I was happy...and have not had one other problem with the 850.

Just thought I'd relate my experience at a local radio shack..

A few days ago I went into a radio shack in the local mall (NorthPark, Dallas).
I found my way to their 2m HT and turned it on and fooled with the controls
(no, I didn't xmit).

As soon as their sales staff noticed what I was doing they quickly jumped up
and admonshed me that I had to have a "special licence" to use that thing and
that I shouldn't transmit (they had taken the rubber ducky off of it anyway).

When I looked at their 10 Meter transceiver I got the same lecture.

I told them I was very pleased at their attitude since I had one of those
"special licenses" in my wallet. These folks did it right!

I realize that we have not yet come even close to exhausting the rich lore of technical, socio-economic, and cultural data on PL-259's and batteries on concrete. Yet, in fact, another 3 or 4 weeks of discussion may indeed close out these subjects, and I fear that we may then be left with an intellectual void. Thus, in the public interest, I propose that we open discussion on #6 flat washers. (My hope is that we can ascertain how various metallurgical treatments affect the generation of magnetic micro-fields through dissimilar metal contact and how these fields might affect junction performance in some mosfet receiver front ends.)

I'll put in my $0.02. I posted the original Kenwood 850 story, so my feelings are known there. Just to be sure though, I had absolutely no problem with the fact that the rig failed. Modern transceivers are complex pieces of equipment and some will always have problems. It was "the service after the sale" I lamented about. By the way, I finally got through to Kenwood's customer relations folks. The bottom line is I shouldn't have waited to talk to them before I sent it in because they didn't promise any special treatment or time because this is the second time around.

With that out of the way, let me tell you about my new Ten Tec Omni VI! I got it last week and have had some (limited) time to play with it. I won't lay out technical details because they've been posted.

I've used it only on CW, but I've listened to some SSB just to check it out. Based on my limited experience, it is a dream on CW. I have the 500 Hz filter in the one available 2nd IF slot and the 250 Hz and 2.4 kHz installed for the other IF. I can still install the 500 Hz and 1.8 kHz in the the first IF. You select one of these and the 2nd one is off/on.

Everything is on the front panel. What doesn't have a knob is set by a simple setup program. To enter the setup routine, you press and hold the

LOCK button for 1 second. You then toggle through the parameters with the ENTER key. You use the up and down arrow keys to change settings for a parameter. This routine is for things that don't get changed often such as serial port baud rate, how it announces the mode selections (CW, beep, or off), the cutoff for the DSP low-pass filter, etc.

I've been running the DSP filter at its lowest cutoff (600 Hz). It really reduces the high-frequency QRN. Your head doesn't fell like its vibrating after having the headphones on in the 40 meter novice band for an hour. That's how I first checked it out. I found a guy calling CQ on 7110 and went back. This is a horrible place to work anytime, especially during the summer. I used the 250 Hz and the 500 Hz filters cascaded. The guy was S5 and it was very easy to copy him. He gave me an S8, but after about 15-20 minutes he said the noise was just too much for him! A couple of days ago I had a QSO with a guy about 100 miles away (ground wave?) on 40. He was S0 - the meter didn't budge, but we had a nice long QSO. Of course, the bands were dead so interference from others was lessened anyway.

To check out the AUTOMATIC notch filter, I tuned in one of the Hispanic guys running SSB in the CW portion of 40 with a strong CW signal right on top of him. I punched the auto filter in and I could hear him clear as anything (I still don't know what he was saying ;). The CW sounded basically like key clicks.

One of the smartest things Ten Tec did was add the second serial port. They kept the original RS-232 port compatible with the OMNI-V (but which no software supports). But they also added a two-wire serial port completely compatible with the Icom CI-V system! Now you can use it with CT and other programs by telling the program you've got an ICOM 735. I'm not sure what "extended commands" it supports yet, but I played around with just frequency changing under CT and it worked great. I said 735 because it comes with the default address of a 735 (0x04). I'm not sure how to change it yet. It should be able to change filter settings, etc. also though.

Well, I've rambled on long enough. E-mail with any specific questions.

2475. DJ-580T problem with audio drop out using T-SQL

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-10 20:39:41 UTC
From: mjr@netcom.com
Message-ID: <v1tn81l.mjr@netcom.com>
Source record: 285548

I'm experiencing a strange problem with my DJ-580T. Been trying to call Alinco tech. support, but its either busy all the time, or their one tech person seems to be busy and hasn't called me back now in 5 hours!

The problem occurs where I have TSQL set for a given repeater (or simplex for that matter) Basically, if I switch away from the memory, call channel, or VFO containing the frequency with TSQL (by jumping to the other band, or hitting the mr key, or whatever) and then jump back, the AUDIO on the unit completely disapears for about 2 seconds and then pops back. I know it is just the audio because if people are talking on the freq. I can see the signal on the Smeter. I don't have to do anything to make the audio come back, it just does by itself after 2 seconds or so. The repeater in question IS using an outbound tone by the way...

Clearing this up step by step...
1) I'm listening to a conversation on a freq. with TSQL set.
2) I pop away (say by pressing UHF). I can still hear the conversation on the first band.
3) I go back to the original band (say by pressing VHF) and the audio *completely* disapears, while the Smeter still shows RF being received.
4) 2 seconds go by and the audio pops back.

This never happens when jumping back and forth to frequencies without SQL (for example with T only) so I know it is related to the SQL feature.

Can anyone shed some light on this???

2476. Satellite rig: Kenwood TS-790a or Yaesu FT-736r?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-10 21:29:57 UTC
From: PTS102@psuvm.psu.edu
Message-ID: <92254.172957PTS102@psuvm.psu.edu>
Source record: 285554

The Penn State ARC (K3CR) will be buying either a Kenwood ts-790a or
a Yaesu ts-790a for use mostly as a satellite rig. We have the
less-than-complete spec sheets from both companies, as well as old
QST reviews. We need to know how the rigs hold up in actual use.
Any experiences/comments/opinions/suggestions would be helpful.

2477. Univ. Calif., Irvine radio club rises again

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-10 21:31:32 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <9209101429.aa21847@Paris.ics.uci.edu>
Source record: 285552

Just a note - the University of California, Irvine amateur radio club, struggling for over a year to become active again, will become active with the club call WB6KGN this month.

Many posts (and messages to me) have gone by on the subject of clubs but alas, I have been too busy to reply or consider. I have renewed committment to club activity. There are a few of us and we intend to come up on HF soon, VHF packet in the coming months.

Any e-mail for the club can come through this address.

Clark

|_____________________________________________________________________|
```

CONFIDENCE LEVEL: 70%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

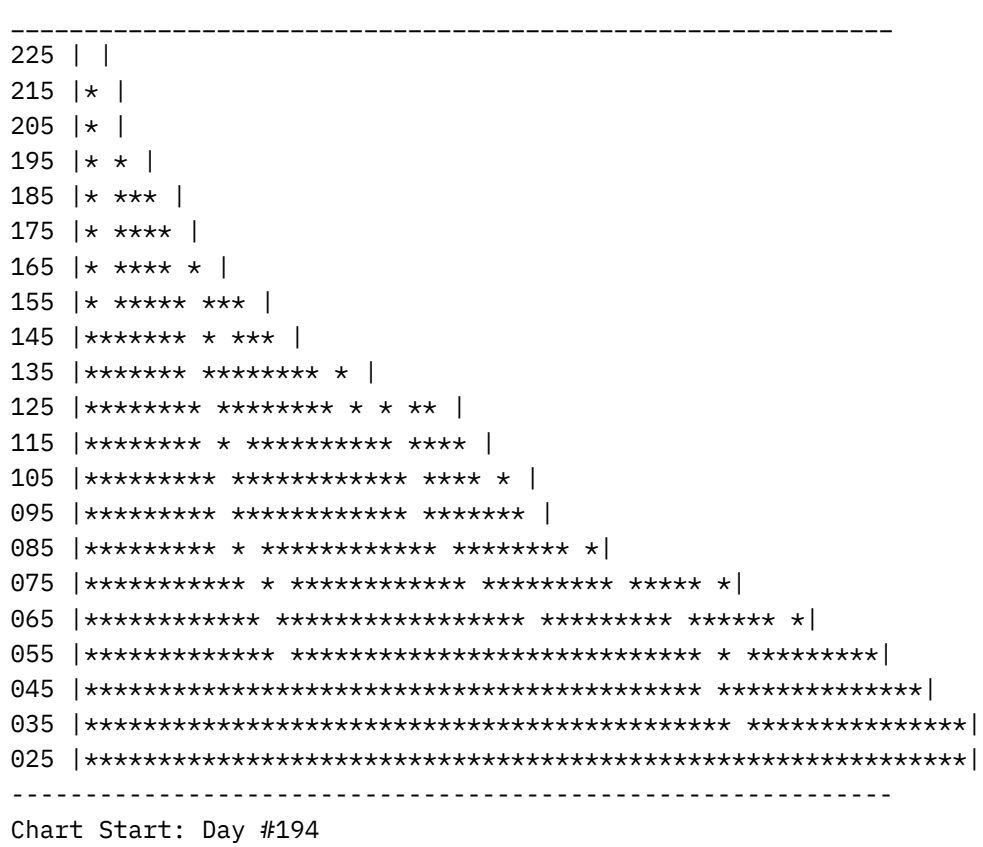
GRAPHICAL ANALYSIS OF 90-DAY AVERAGE SOLAR FLUX

```
------------------------------------------------------------
135 | |
```

NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

CUMULATIVE GRAPHICAL CHART OF SUNSPOT NUMBERS



NOTES:
The graphical chart of sunspot numbers is created from the
daily sunspot number counts as reported by the SESC.

NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "Oler@Rho.Uleth.Ca" or "COler@Solar.Stanford.Edu". This document, as well as others and related data and forecasts exist on the STD BBS at: (403) 756-3008.

I am glad to hear that. Here in Europe most ham radio stores
would also ask for your license, or at least want to see your
ID and have a look at the newest callbook. The same apply to any
ham selling used gear to strangers. There are too many people
using ham rigs on 27MHz or whatever freq they please and run their
pirate stations.

I once had a qso with one ON-station who reported there are maybe
more pirate hf-stations qrv than real hams! Does anyone have an
idea about that estimate?

>of 813-867-8876. The individual will present a Florida drivers
>license beari the same address, that haexpired on 29 July 92.

After working a few years in retail, here is a guide to taking
checks. The following are all suspicious:

1) A low check number. The account may just
have been opened. Be suspicious of check numbers below 500.

2) An expired driver's license. Always ask for a driver's
license as an ID on checks. Examine the license carefully,
especially the picture. Look for signs of alterations.
(the picture may have been pasted on)

3) An address on the driver's license that is different
from the one that is on the check. If he can show
you some other form of ID with the same address, that is OK.

4) A check that does not have a pre-printed name and address.
Do not take such a check ever, unless it is for a very low
amount.

5) A non-driving ID instead of a driver's license. In California,
non-driving ID cards are very easy to get.

6) The person appears to be nervous, in a hurry, or
gets angry when you ask for ID. Every bad check that my
store took was from someone who was in a hurry.

7) He/she is with someone who seems to be in a hurry, or seems
suspicious in some way. Bad check writers often work in teams
of two. Some of them are real pros.

8) You are selling something that would have a high black
market value. Car stereos, CBs, home stereos, TVs, jewelry,

VCRs, and other high-priced mass-market consumer goods fit this category. Ham radio equipment generally does not have a mass market appeal or a high black market value.

If the above person had followed these guidelines, he would not have taken the check. Here are a few other guidelines:

1) Since the person is buying ham equipment, have a copy of the Callbook with you and look up his call sign. If he has no call sign, perhaps you should not sell him ham equipment.

2) If possible, call information and ask for his phone number. It should match the one printed on the check. If his number is unlisted, add it to the above suspicion list.

3) If you are suspicious, ask for other forms of ID. A major credit card (Visa, Amex, Master Card) is a good form of ID. Do not write down the number, as this is illegal in some places. Department store credit cards are useless, as they are very easy to get and usually have no expiration date. Make sure that any form of ID is still valid and not expired.

4) If you are suspicious, work out a deal where he gives you at least some cash along with the check.

When all is said and done, you will need to use your own judgement. In general, hams at flea markets are fair and reasonable. However, if you use some common sense, you can protect yourself from getting ripped off.

I would recommend the Icom 735. You may be able to pick one
up used for $600-$700. The 725 and 726 are also good rigs, and
their prices should be coming down now that they've been
discontinued. (The 725 was selling new recently for only $750)
Icom's service is excellent, as I and many hams on the net have
said.

Source record: 285560

CAUTION: Alinco switched from postive sleeve to negative sleeve on their most recent line of HTs.

The dj-160T has a positive sleeve. The dj1-ft has a negative sleeve.

The connectors are otherwise identical. Bad design. They should have changed the outer dimensions on the connector so one couldn't pysically connect uncompatible accessories. Lucky for me no damage is done when you use the wrong polarity.

One must get the proper accessory when ordering from Alinco. You must specify the type of HT.

```

I don't see how such a thing could be done. The Icom 725 seems
to be a no-frills rig, and the prices recently for a new one
came down to about $750. I don't think an all-band HF rig with
2 VFOs has EVER sold for as low as $400, not even in the good-ol days.
I saw an ad for a Drake TR-4 from the early 70's that sold for $600
new.

Thanks for the personal note Willie. BTW the email address that
I include with every post does work...

>9913 and UHF connectors don't mix for a number of reasons:
>

I think you missed the thread on this one. The issue was about connectors
and not about 9913. The thread started with some one _else_
enquiring about PL 259's on 9913 and that resulted in a huge spate
of comments about using PL259 on HF. My remark was a tongue-in-cheek
^^^^^^^^^^^^^^^^^^^^^^^^
one about the miniscule impedance mismatch at HF that results of using
UHF connectors instead of N connectors on HF.

>1) 9913 cable is of no practical use for HF in terms of attenuation.
>RG-8 is nearly as good (0.3 dB more attenuation per 100 feet), costs a
>_lot_ less, is more flexible, and is more weatherproof with PL-259
>connectors. 9913 is only useful in 'real' VHF and UHF work, above say
>30 MHz.
>

Since _you_ bring up the topic of use of 9913 type coax for HF, let
us discuss that for a moment. Your figures are correct only if
the SWR is 1:1. The effect of line attenuation gets substantially
worse as SWR gets higher. As in my case where I use a 80m full
wave loop for all the HF bands. The SWR on the line gets higher
than 5:1 (especially on 30m) and I use an antenna tuner in the shack.
Now if the line were lossless, by the Conjugate Matching Theorem, it
would as good as having a tuner at the feedpoint of the antenna.
Now introduce line loss. The story gets really interesting:
For line attenuation: 1.0db power loss: 2.2db (at 1:5 swr)
0.6db power loss: 1.4db (at 1:5 swr).

(These are approximate figures read from a graph in a hurry. The
exact number can be determined using formulas.)

>2) PL-259s are not suited for UHF work, above say 300 MHz (2M is
>marginal, IMHO). The impedance discontinuity you discussed becomes a
>_lot_ more significant at (say) 450 MHz, so you must use a decent
>connector like N-type. At these frequencies the attenuation of RG-8

>is about 2.0 dB per 100 feet, and 9913 is a lot more widely used.
>
>Therefore, if you are talking about HF, you shouldn't use 9913, and if
>you are talking about VHF/UHF you shouldn't use PL-259s. Hence the
>question of using PL-259s on 9913 shouldn't ever come up. If someone
>_gave_ you some 9913 for use on HF, I'd suggest you sell it and buy
>some RG-8.

Thank you for the suggestion. In any case, I will sell all the 9913
that I have. Which is none. :) I do have some International 9086
(similar to Belden 9913) that I use on HF and have no intention of
selling that. I would have liked to use open wire feed line and
cut down on losses from using the loop even further, but running
it close to metallic gutters and down spouts did seem like a good idea.
So I chose 9086.

}Gary KE4ZV

>I dunno: I remember once on a StarTrek episode where they went thru
>a concrete barrier at the end of the galaxy and it discharged all
>their dilithium crystals...

Well, yes, there's that too. But mostly what happens is that the
electricity that leaks out from A and B drips over the sides and then
it shorts across the concrete. If you put wood under the battery it
soaks up the electricity before it can get to the concrete.

I suggest that this topic be included in the Extra class tests, it's
pretty important that hams know about it. It's knowledge like this
that distinguishes us from the CB types - they think the electricity
leaks out at C and D - can you imagine anyone being that stupid?

And to those doubters who don't believe that concrete is a conductor -
I have heard that just about every building that is struck by lightning
has concrete in it somewhere, you can't ask for better proof than that.

2490. Re: DJ-580T problem with audio drop out using T-SQL

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-11 03:39:35 UTC
From: jab0684@usl.edu
Message-ID: <1992Sep11.033935.17212@usl.edu>
Source record: 285568

Also owning a DJ580-T myself I notice a similar problem with the Tone
Squelch in repeater usage. While I have no trouble opening up the repeater
I find the the conservation tends to come off and on even though the
Smeter has a FULL reading. This happens whether or not I switch bands.
Sometimes the audio opens up, sometimes it dosen't. I thought I followed
the instructions in the manual, but I could be wrong.

Could it be that the repeater dosen't always properly re-trans the
sub audible tone, and that maybe it is getting clipped?

I thought that the battery save feature might be affecting this, but turning
it off seems to make little difference.

2495. Help With 432Mhz Yagi

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-11 05:21:47 UTC
From: jcw@kd4dts.dixie.com
Message-ID: <1992Sep11.052147.18096@kd4dts.dixie.com>
Source record: 285577

Time to call for help. I want to build a 432mhz Yagi. There are two designs in the ARRL Antenna Handbook, both of which have good points and bad points.

The first antenna is the NBS 3.2w 15 element antenna. This one is real nice because the boom is under 8", which is a common size of 1" aluminum box section. However, I can't figure out how one is supposed to feed this thing. There is no discussion I can find on how this might be done.

The second antenna is a 15 element Yagi, with a boom length of 117" (9.75 feet). I understand how to feed this, but don't know what the implications of either shortening the inter-director length is, or just eliminating two of the directors would do. I know it would obviously affect the gain and F/B ratio, but by how much?

Can I use the feed technique from the second antenna to feed the first? Also, in the feed technique for the second, they mention using "Steatite" standoffs. I'm not an antenna expert, but I would assume that these are insulated, seeing as the feed line is attached to these standoffs, and the otherside of the standoff would be ground.

If you have the Handbook, the first antenna is on page 18-10,11 and the second on pages 18-26 and 27.

Any help that can be given would be seriously appreciated.

I have noticed it also. Lead-Acid cells DO discharge much faster
when sitting on concrete vs sitting on a table 4' high.
A semi-controlled experiment showed a 12% increase in discharge rate
when on concrete. I don't believe temp or shock was a factor.

Probably been said before, but ATLAS radio is back in business and
about to produce the Atlas 310, a no frills, but good basic HF radio
-- with a price tag of about $700 (as introductory price). The price
is not a bunch lower than the Japanese no frills rigs but the ATLAS
will have several advantages:
- 150 watts output (a little higher than average)
- smaller package (great for mobile)
- very serviceable boards, no special chips, etc. (how Atlas builds them)
- analog dial backup below digital readout (can switch off digital to save
current)
- crystal mixing for receiver, no phase noise like in synthesized designs

And other standard features like all the other low end HF rigs.
I am not here to push the Atlas (but I am really happy they are back),
in fact, I own ancient Ten Tec radios that I like a lot.

2500. Using Ham Equipment in Other Services

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-11 08:21:12 UTC
From: jab0684@usl.edu
Message-ID: <1992Sep11.082112.25434@usl.edu>
Source record: 285575

Is it lawful to use ham equipment in other services?
For instance one ham tells me that even if you observed the power rule of
4 watts for am, it would be illegal to trans mit in CB channels with
a ham HF rig. That only a type accepted cb transmitter is accepatable.
Is this indeed the case?

Assuming a 2 meter rig can transmit in the Marine radio bands is it legal
to use to for communicating with other boats? Or is another special liscense
required(I thought I read it was). Even if a liscense is required
do I have to use a type accepted marine radio like I do for CB?

Lastly please post the frequency for marine channel 16(emergency channel),
since surely it would be licit to transmit here in an emergency situation
with a 2 meter ham rig.

> in? What will happen?

Sorry, I was a little ambiguous with my last posting.

The BC-14 puts out only 75mA.

The car adapter should easily put out 2A.

If you use a hefty home power supply, the batteries will charge while you use the radio.

If you don't have the battery in, that is fine as long as the power supply can push enough current.

Nothing like real numbers I always say. I went out and measured my dirty garage floor, bare concrete, when dry. The result was 5 Megohms per foot. Then I poured a cup of tap water on the floor and measured again, 50,000 ohms per foot. So tap water on a dirty concrete floor does reduce the resistance, but I still wouldn't call 50 kohms a *very* good conductor. It's low enough to give you a jolt if you were barefooted and grabbed a live 110 VAC wire, but a 12 volt battery could only push .00024 amps across it, hardly copper.

>QST reviews. We need to know how the rigs hold up in actual use.
>Any experiences/comments/opinions/suggestions would be helpful.
>73, Pat ny3x

I originally bought a Kenwood 790A to replace my lightning struck
Icom twins. I'm using a Yaesu 736R now. Nuff said?

The Kenwood looks good in the store, but it's *not* an effective
satellite radio. For example, to make the 70 cm and 2 meter VFOs
track, you have to *hold down* the SAT button. You can buy narrow
filters for the radio, but they only work in the *main* band unit.
Meanwhile, in satellite use, you listen on the *subband* unit and
transmit on the main unit, so the narrow filters do you no good.
The 70 cm PA died in the first month of use. As usual with Kenwood
VHF/UHF equipment, there is inadequate heatsinking of the PA modules.
The top of the radio gets very hot after only a few minutes of
use. Took over a month to get it serviced too.

The Yaesu is a much nicer radio. It works the way you would want
a satellite radio to work. It's a more conservative design with
a good heatsink. It allows narrow filtering on recieve in satellite
mode. It has both IF shift and a working notch filter, a good VOX,
good audio, variable power control, etc. The only drawback to the
radio is that unlike newer dualbanders, you can't monitor two bands
at once. You can listen to either band, and transmit on either band
independently, but you can't monitor a 2 meter repeater while listening
to a 440 repeater. That's not a requirement for a satellite radio,
but the Kenwood and Icom allow you to do it.

The Kenwood has a surprisingly decent GASFET frontend that seems
overload proof, as does the Yaesu. The much more expensive Icom 970
is useless in a high RF environment. Otherwise, the Icom is the ideal
satellite radio. It has all the features you would want, and then some.
So if you live on a farm, it's worth a look.

Note that the quality of the receiver is *the* issue with satellite
radios. You're dealing with weak signals, and surprising pileups.
It helps though, if the transmitter works and the controls make
sense. Today I'd say go with the Icom Twins (275, 475) or the
Yaesu FT-736R as your best choices. The Yaesu is cheaper and all
in one box while the Twins are more flexible. I used to have an
older pair of Twins (451, 211) before lightning visited.

Gary KE4ZV

2505. 3 Kenwood questions

Newsgroup: rec.radio.amateur.misc

Source record: 285478

I have been shopping for an HF rig to use as an i.f. for
my VHF station (HF rig + transverters). In looking through
the Ham Trader Yellow Sheets, I see a remarkable number of
TS-850s for sale, often at very low prices considering the
youth of this rig. Question 1: Why are so many people selling
off their '850s? Is there something wrong/awkward/dissatisfying
with it?
Question 2: What was wrong with the '950? I gather that it
was not very well-received despite good lab specs. What was
the problem, exactly?

Question 3: What is really new in the TS-950SDX? Are the "changes"
real or cosmetic? Of course, this is related to #2.

From: bill@prijat.cs.uofs.edu
Message-ID: <10997@platypus.uofs.uofs.edu>
Source record: 285489

I have been following this debate with considerable interest.
I also think it is a good idea, but what I have often wondered was
why no one petitioned the FCC to create a simple service (or maybe
even make it a part of Part 97) that set up a set of simplex frequencies
just outside the various VHF/UHF bands and designated this for contact
between local emergency services and hams. As MARS has proven, the
gear can handle it and so can the operators. The advantage to the
emergency services is the frequencies will be specified and the same
everywhere making it relatively easy to get equipment. Making Commercialy
manufactured HAM gear acceptable would also keep the cost of offering the
service low enough that Comm-Centers would be likely to participate.

Don't kid yourselves, Ham HF rigs are consumer equipment and are
marketed as such. [DDemographics show that Hams are getting middle
aged, established, have some money to burn and generally buy what
they (think) they want. What would you build in your factory?

Between 1970 and now, I can't think of a single other piece of consumer
grade electronics that hasn't dropped in price (even with the
years of big-time inflation). I was just looking at an RCA 20"
remote controlled, synthesized tuner color TV for $200. What
did the equivalent in the RCA line cost in 1970 -maybe $500?
Given the lower volume, the efficiently built progeny of the
TR-4 should sell for about $300. It'll never happen.

Ken - WB0QNA

2508. COLUMBUS DAY SPECIAL AMATEUR RADIO EVENT DETAILS

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-11 12:55:52 UTC
From: WILKINSO@vmd.cso.uiuc.edu
Message-ID: <1685F6F88.WILKINSO@vmd.cso.uiuc.edu>
Source record: 285481

NOTICE OF A RADIO AMATEUR SPECIAL EVENT OPERATION

BAHAMAS: The Bahamas Amateur Radio Society will operate C6A500 throughout the month of October 1992 to commemorate the 500th anniversary of the discovery of the New World by Christopher Columbus. Operation will be continuous during 0001 Z to 2359 Z, October 12, otherwise intermittent coverage will be kept through October. Frequencies to be used: 3590, 3740, 7030, 7090, 7290, 14,070, 14,135, 14,290, 18,150, 21,140, 21,204, 21,390, 24,950, 28,190, 28,350, 28,990, 146.640D-600. All authorised BARS members may operate in October with /500 suffix. Awards: 1) Three different /500 contacts; 2) Ten different /500 contacts, one of which must be C6A500. For QSL send SAE & three IRCs to BARS, Box SS.6004, Nassau, Bahamas, or Bahamas Bureau. For award, send copy of log & three IRCs.

NOTE: I am transmitting the above data on this Columbus Landing Special Event at the behest of the Bahamas Amateur Radio Society, Rhinehart Pearson, C6ANO, President, and Carolyn Wardle, C6AGG, Assistant Secretary.

For a number of years US hams, N9HXL/C6A, and N2HOH/C6A, have been operating on the small island of San Salvador at the vacation cottages of Dr. Henry T. Wilkinson, (See QST: September, 1990, 50.) A small antenna farm has been developed and is being expanded for operation during the Columbus Special Event. We have been giving some assistance to BARS in setting up the event and plan to be part of the operation on San Salvador during October. We are being joined by WE3Z/C6A (exN3GTW, (See QST: july, 1990, 46.)

>can be used).

Absolutely, on 20 M on up. In certain situations it solves some space problems gets the signal up in the air, and no radials. If you own your own home and have space, fine. If you need a compromise ant then a vert dipole MIGHT be an answer

Hmm, as near as I can tell, "National Simplex" is the _only_ frequency
that's guaranteed to be simplex, all other so-called 'simplex'
frequencies are 'local option' repeater inputs or outputs. Are there
really 'simplex' subbands on which you will _never_, anywhere in the
US, find a repeater input or output?

Virtually any thing built for use outside amateur bands has to
be type accepted before it is legal to use it. Ham equipment
cannot be used for most other services. The military is the
major exception.

>Assuming a 2 meter rig can transmit in the Marine radio bands is it legal

Not only must marine radios be type accepted, but you have to have
a seperate license for a boat radio, a shore radio, etc.

>Lastly please post the frequency for marine channel 16(emergency channel),
>since surely it would be licit to transmit here in an emergency situation

It is legal to use anything that sqeaks anywhere when emergency
life threatening conditions truly exist.

I purchased my ICOM-735 before I had my license. I also did not transmit until after I did. I wanted to get a start on tuning in and listening. IF I had been refused a purchase I would probably never have gone back. I mean gosh golly, what if say I wanted to purchase that new ham radio for my good buddy (ok, so assume that I was rich and really liked this person) or spouse and wanted to purchase them a gift etc.....

Forcing a ticket before purchase seems undully restrictive although warnings as to proper use and such is definitely a good thing.

IF there are lots and lots or illegal radio operators why don't the regular HAMS sniff them out and turn them in?
<note, serious question above>

But there's another mystery here guys! In the the drawing above, there is
a series circuit from B-D, D-C then C-A allowing the current (electrons) to
flow. We all know that in a series circuit, this current flow is the same

anywhere. So, if the number of electrons leaving the battery are the same quantity as the ones entering the battery, then why does the battery discharge? ;-) (Extra credit, Extra class question?)

Maybe this is the same problem my dad was asked when he was in the home remodeling business. He was asked "How many electrical outlets can I have before I run out of the 110V?" :-) (Novice class pretest question).

I don't know why so many 850's would be on the market used...but I can tell you that the only problem that I've had with my 850 was a bad mic that they (Kenwood) replaced right away no questions asked. Also I have 2 other ham friends here in Denver that have also bought 850's neither have had any trouble and both like the 850 very much.

No...I don't work for Kenwood...just one of their happy customers.

Paul Anderson WB0ZRD at AT&T Bell Labs in Denver.

QST DE W1AW
SPACE BULLETIN 035 ARLS035
FROM ARRL HEADQUARTERS NEWINGTON, CT
SEPTEMBER 9, 1992
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

SB SPACE ARL ARLS035
ARLS035 STS47 NUMBER 1

SAREX SPACE SHUTTLE STS-47 IS TENTATIVELY SCHEDULED TO LAUNCH
SEPTEMBER 12 FOR 6 DAYS OF 2 METER OPERATIONS, WITH N5QWL AND 7L2NJY
ABOARD.

OPERATORS ARE JAY APT, N5QWL AND MAMORU MOHRI, 7L2NJY. N5QWL IS THE
FLIGHT ENGINEER FOR STS-47 AND WILL OPERATE THE SHUTTLE SYSTEMS
DURING THE ''NIGHT'' SHIFT, WHILE 7L2NJY WILL BE ONE OF THE SCIENTISTS
PERFORMING EXPERIMENTS IN A LABORATORY IN THE SHUTTLE'S CARGO BAY
DURING THE ''DAY'' SHIFT. THE TWO WILL USE THEIR OWN CALLSIGNS ON FM.
ON PACKET THE CALL SIGN WILL BE W5RRR-1.

ALL VOICE OPERATION WILL BE SPLIT, DOWNLINK FREQUENCY FROM THE
SHUTTLE WILL BE 145.55 MHZ, UPLINK FREQUENCIES FOR ALL AREAS EXCEPT
EUROPE WILL BE 144.95 AND 144.91. EUROPEANS SHOULD TRANSMIT ON
144.80, 144.75, AND 144.70.

FOR MAXIMUM EFFICIENCY AMATEURS ARE ASKED TO SIGN THEIR ENTIRE CALL
SIGN, USE ONLY STANDARD ICAO PHONETICS, TRANSMIT ONLY ON UPLINK
FREQUENCIES, AND LISTEN BEFORE TRANSMITTING.

IF YOU CAN, DECREASE YOUR RADIO'S DEVIATION TO 3 KHZ (MOST ARE
INITIALLY SET AT 5 KHZ) TO COMPENSATE FOR THE DOPPLER SHIFT.
OTHERWISE, WAIT UNTIL 60-90 SECONDS AFTER THE SHUTTLE COMES OVER
YOUR HORIZON TO TRANSMIT. IF A STATION TRANSMITS WITHOUT FOLLOWING
THESE SUGGESTIONS, THE SHUTTLE OPERATORS HEAR WHAT SOUNDS LIKE A
NOISY CARRIER. THIS APPLIES TO BOTH VOICE AND PACKET.

UP-TO-DATE INFORMATION ON THIS OPERATION MAY BE FOUND ON AMSAT
BULLETINS, COMPUSERVE, GENIE, PRODIGY, LOCAL PACKET BULLETIN BOARDS,
ARRL BULLETINS, AND HF VOICE FROM NASA JOHNSON SPACE CENTER ARC IN
HOUSTON (W5RRR), OR FROM NASA GODDARD SPACEFLIGHT CENTER ARC,
```

GREENBELT, MARYLAND (WA3NAN), ON THE FOLLOWING FREQUENCIES:

W5RRR: 7.215, 14.280, 21.360, AND 28.400 MHZ. WA3NAN: 3.860, 7.185, 14.295, 21.395, AND 28.650 MHZ.

THE NASA INFO BBS AT JOHNSON SPACE CENTER, HOUSTON, WILL CARRY KEPLERIAN ELEMENTS AND SAREX BULLETINS. CALL 713-483-2500, 1200 BAUD, 8-N-1. AT THE ENTER NUMBER: PROMPT, TYPE 62511 (RETURN) AND LOG ONTO THE BBS. THE KEPLERIAN ELEMENTS AND BULLETINS WILL BE IN THE WELCOME MESSAGE. DISCONNECT PROMPTLY TO FACILITATE ACCESS BY OTHERS.

NASA OFFERS THE FOLLOWING OPERATIONAL NOTES: N5QWL WILL BE ASLEEP OVER MOST USA PASSES, AND 7L2NJY WILL BE BUSY WITH LABORATORY DUTIES FOR MOST US PASSES, SO TRY PACKET OVER THE USA. THE OPERATORS WILL TRY TO WORK VOICE WHEN NOT OTHERWISE ENGAGED, AND AT NIGHT OR WHEN THE GROUND IS CLOUDY.

NO ORBITER MANEUVERS ARE SCHEDULED AFTER THE FIRST 6 HOURS OF THE FLIGHT, SO ORBITAL ELEMENTS OBTAINED EARLY IN THE FLIGHT MAY BE VALID FOR THE ENTIRE FLIGHT.

QSL TO N5QWL, 806 SHOREWOOD DRIVE, SEABROOK, TEXAS 77586 USA, WITH THE USUAL SASE OR EQUIVALENT. INCLUDE THE CALL SIGN WORKED, DATE, UTC, MODE, AND FREQUENCY. FOR PACKET CONTACTS, INCLUDE THE QSO NUMBER ISSUED BY THE ROBOT.

HERE ARE THE PRE-LAUNCH KEPLERIAN ELEMENTS, BASED ON A 1423 UTC LAUNCH ON SEPTEMBER 12:

1 00047U 92256.65952624 .00092000 00000-0 29200-3 0 59

>From ARRL Headquarters Newington CT
September 11, 1992
Relayed by KB8NW/OBS & BARF-80 BBS
To all radio amateurs

SB DX ARL ARLD047
ARLD047 DX NEWS

Thanks to Tedd, KB8NW, the Ohio/Penn DX PacketCluster Network and
Jacques, W2/F2YS, for the following DX information.

PACIFIC ADVENTURE. Marcel, ON4QM, started his 3 month tour by
signing 3D2MD from Fiji. Plans include travel to West Kiribati,
Tuvalu, Niue, Nauru, Tokelau and Tonga. MArcel will end up back on
Fiji before finally heading home.

PUT ON HOLD. According to DXNS, the proposed KH1 DXpedition to
Baker and Howland has been postponed until late January or March
1993, due in large part to lack of operators. The JA2NQG and JA0GZ
trip to Lord Howe Island has been postponed until February 1993.

EAST KIRIBATI. Garry, NI6T, reports he and a group of Northern
California DXers will operate from Christmas Island from September
23 to 28. They plan to be active as T32RA in the CQ WW RTTY
Contest. Outside of contest hours they will be on 160 through 10
meter SSB and CW. Calls will include T32RA, T32CW, T32GV, T32RS,
T32WS, T32SS AND T32GG.

BIKINI ATOLL/MARSHALL ISLANDS. Richard, AH6IO, and Pat, NH6UY, will
be active from September 28 through October 8. Richard will be on
160 through 6 meters, while Pat will operate satellites with Mode A
and J. Pat says to listen for him on or near 145.915 MHz downlink.
Callsigns will be V73IO for AH6IO and V73UY for NH6UY. Only QSL
direct to their callbook addressess.

MINAMI TORISHIMA. ESDX, the European Satellite DX group, reports
Kuruja, JJ1ZNF, will sign JD1/JJ1ZNF/P for a new country on the
satellites. The starting date of this operation will be near the
end of September and Kuruja plans to stay on the island until the
```

middle or end of November. Look for him between 1300 and 1400Z, and again between 2000 and 2100z.

9K, KUWAIT. Bob, N6BFM, 9K2ZZ et al, and his XYL are moving from their present QTH in A6 back to Kuwait City and should be back on the air in 3 or 4 weeks. He hopes to be very active on 80 and 160 meters this winter.

MARKET REEF. DX/Conetst club station OH1AF will be active as OH1AF/OJ0 starting October 6 for a one week operation. They will use CW, RTTY and SSB on all bands, including 6 meters, VHF/UHF and some satellites. Special attention will be given to 28 and 50 MHz. Two or three HF stations will be active. QSL CW Qs to OH1NOA and SSB Qs to OH1EH.

CHAD. Ken, WA4OBO, has postponed his trip until mid-October. He plans 4 full days of operating on 80 through 10 meter SSB around the CQ WW SSB DX Contest. He will then be moving north on business, but will be in Chad again in March of 1993 for 3 weeks.

COOK ISLANDS/NIUE. Ron, ZL2TT, will be visiting Cook Islands, ZK1, for a week starting September 12 and should be active on 40, 20 and 15 meters. And from September 19 he will be on from Niue, ZK2. QSLs to CBA.

COUNTY HUNTERS. Richard, AH6IO, says there will be a special event station on Kalaupapa peninsula November 13, 14 and 15. Activity will be on 160 through 6 meters with a possibility of some satellite work. This is one of the rarest U.S. counties.

WARC BAND ACTIVITY. 30 meter spots include the following goodies. 5N0ZKJ, SM6CST, KE9I/V2, FK8GJ, OD5/SP1MHV, ZA1J, UB4CM, LZ1FI, FY5FA, HA7PF, ZA1C, ZA1BK, 9H3PB, KL7S AND OD5/SP7LSE.

On 17 meters there was ZD8LII, EA6ZY, IS0OMH, ZD8LII, PP1CZ, V2/KE9I, OD5/SP7LSE, P40P, LA4RJ, 4K4NN, SV0MG, U0AG, TK/HB9ASZ, PY2EYE CE3ZW, GD4RAG, VQ9QM, F6BLQ/D2, FY5FJ, ZK2VJ, VP2V/KE9I, ZL2AAG, CN8NS, NL7WH, V2/N4WQB, ZS6YA, 5N0MRD/6W1, NL7J, PZ1EE, TK5BF, T77T, TG9AJR, XE1CI, 6Y5CE AND FK8CP.

And on 12 meters, PY5TRT, PJ2/NX1L, P40P, VK3CWB, VQ9QM, VK4KO, OA4BCZ, 9H1NB, CE3GEI AND ZD8Z.

CAMBODIA. Antoine, F6FNU, is the QSL Manager for XU0NU, XU1NU and XU2NU. These stations are part of a French contingent to the UN peace keeping forces.

RRECTION TO ARLD036 AND ARLD045. Under item one, FR/G/E/J, Indian Ocean, the correct QSL route for FR5ZU is:

>over a year ago and I love it. The receiver is great and I get nothing
> a 'good service' story deleted

I too have a Kenwood TS850s that I purchased a year ago and love it.
Like the QST review said "best CW rig in any price class" (I'm sure
they were talking only about Amateur Radio grade equipment.). Some of
its special cw features are:
* cw receive offset select. I am not talking about RIT but the basic
offset that produces the characteristic cw beat tone. Changing the
offset has has the effect of changing the receive pitch without
changing zero beat freq. This used to be trivial when there was
a separate BFO control and became difficult with the digital rigs
that had a fixed offset of 800 or 750Hz.
* can change the sign of the offset by hitting the REV button. This allows
the receiver to offset above or below the zero beat freq. A great qrm
fighting tool.

Add to that, cascaded and independently selectable crystal filters in two ifs,
and dual slope tuning and it makes for a nice cw rig. BTW, it has an option
that lets the 850 store three 50 character cw messages (any speed that can
be set using the internal keyer) and three audio messages of 16, 8 and 8 secs
(these times can be doubled by halving the digital sampling rate. This is
selectable indepedently for each memory.) These messages can be strung
together in one transmission.

Apart from bells and whistles, its receiver is exceptional. QST reviews
apart, I did a non-scietific head to head test with my friend's new
ICOM 765 and his Drake TR7. We did this at my friends shack and used an
antenna switcher to switch the same antenna between rigs. In terms of
pure RF performance, the Kenwood and the Icom blew the knobs of the
Drake (15-20 yrs of technological difference is a lot). We
could find no discernible difference in basic radio performance
between the Kenwood 850 and the Icon 765 in a full weekend day of
operating.

The 850 does have its flaws.
- there is no rit/xit clear button. While I generally view this as a
disadvantage, the implementation does have its advantages in a round
table in being able to transfer the value between RIT and XIT. This
makes it easier to answer a station back exactly at the listening frequency.
- The noise blanker is not as effective as that in the Icom 740 that
I owned previously.
- While the filters for each IF can be selected independently, the filter

select button for each IF cycles through all the choices.

2520. Number 6 washer (was New Topic)

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-11 14:57:02 UTC
From: Hugh_E._Wells.El_Segundo@xerox.COM
Message-ID: <"11-Sep-92..7:55:44.PDT".*.Hugh_E._Wells.El_Segundo@Xerox.com>
Source record: 285493

Steve, W3GRG, brought up an interesting subject regarding washers.

I would like to relate one that had us baffled for some time that involved star washers. Yes, the answer may be obvious, but is it! In one of our projects where we were grounding VHF circuit boards to metal bosses on castings, we experienced intermittant grounding. The circuit would occasionally oscillate as if the ground was missing. In the original design, a star washer was used under the head of a screw to bite into the plated pad on the top of the board. Plated thru-holes were used to make a connection to the plated grounding pad on the bottom side of the board. The assembly was pressed against a flat casting boss to achieve a casting ground.

The bottom line is that when the star washer was removed, the intermittant condition cleared up permanently. We theorized that the impedance of the star washer connection was higher than the screw head directly against the plated pad.

>Question 2: What was wrong with the '950? I gather that it
>was not very well-received despite good lab specs. What was
>the problem, exactly?

I've spent some time in front of a TS950SD, as well as an IC-781 and an FT1000. The 950 is my least favorite radio of the three; it's more difficult to operate, and in full break-in CW mode, it has a very annoying thump after every element.

The 781 is a very nice radio...for $5K, it damned well better be...and the bells, whistles, and gongs are occasionally even useful.

If I were to go try to buy any of the three, though, it'd be the FT1000. Not quite as featureful as the 781, but it works just as well for the things it does have, and is nice and smooth on the bands. Full breakin CW is a dream, too. All in all, a very good rig.

The FT736 needs a lot of modifications before it's OK for G3RUH 9600 baud.
The best place to find more info is 9600 baud oscar users.

Yes, it is the radiation angle, which is why I referred to the vertical
pattern. But, I guess we have different opinions on what a "monster"
antenna is. I always though W3GM's "little 3 element" job on 40 meters
qualified. It was the only antenna I used on 40M SSB in a DX contest
and really had fun. I still remember that VK telling me I was off
frequency (he turned it back before I could set my transmit frequency
properly) but it didn't matter because I was so loud ...

>I used to have a 3 element beam at 70 feet, and it worked remarkably
>better for long haul work than the G5RV in the trees that I use now.

>came the tribander and up went the satellite antennas.
>
>Gary KE4ZV
>
But, at my Hawaiian location in poor conditions, stations with 3 elements at
70 ft were often in the noise. The really big stations with aluminum
at 140 or 200 ft would come through when nobody else was. And,
since they heard my QRP station, I knew it was antennas in a good
location, and not just power. Of course, there aren't many
stations like this--I'd only work a few East coast stations operating
much of the weekend.

RACESBUL.238 DATE: Sept. 7, 1992

SUBJECT: MGT - WILD FIRE VOLUNTEERS - PART 1/2

The California Department of Forestry and Fire Protection
(CDF) has a Volunteers in Prevention (VIP) program to involve and
use individual citizens and public service groups to reduce
California's wildland fires. We frequently receive inquiries
from other states about this worthwhile and growing program.
In the past few years California has experienced a
tremendous increase in the number of wildland fires and fires
will continue to cause resource loss and financial drain on the
public.

Volunteers in Prevention receive training in the Department's fire
prevention policies and practices. Volunteers, under the direction and
supervision of a CDF employee, may be used for the following activities:

1. Conduct fire prevention education programs at preschool and
elementary schools.
2. Assist CDF in major fire information centers.
3. Assist in disseminating fire prevention education and
information materials to local citizen groups, business, and
schools. Also assist in fairs and other fire prevention
displays.
4. Patrol selected hazardous areas during fire emergencies or
periods of high fire hazard. These are called "Red Flag"
patrols, as one goal of this program is to reduce fires caused by
equipment use, arson, debris burning, and children playing with
fire.

(To be contined in part 2/2)

2525. Re: Yaesu FT-ONE Owners?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-11 16:26:40 UTC
From: dubner@hpspkla.spk.hp.com
Message-ID: <44070001@hpspkla.spk.hp.com>
Source record: 285502

With the thread about poor customer service from the "big three" amateur radio manufacturers, perhaps others will find it interesting that I came away very favorably impressed with Yaesu's replacement parts service. I needed a couple of crystals for my FT-ONE (to fix the drift problem mentioned in the basenote). The rig has been out of production for about 8 years.

I called Yaesu and got the typical (and not unexpected) automated-phone-system-with-all-lines-busy response, but I took them up on their offer to leave a voicemail message. I specified the two part numbers that I wanted to order. The next morning, a Yaesu representative called back with prices and availability already in hand and took my order!

The parts were very inexpensive ($4.50 for a 20 MHz crystal and $11.50 for a 24.5 MHz rock). Alas, that's probably the root cause of my alignment drift problem. I don't see how a $4.50 crystal can provide a long-term stable reference for a PLL synthesizer. My original crystals had drifted out of the range that the trimmer capacitors will correct and I have no reason to believe that these replacements will be any different.

I'll probably order some custom crystals from a crystal manufacturer next time, but I was very pleasantly surprised by Yaesu returning my phone call and having the parts.

Joe, K7JD

2526. PL259 connectors on 9913

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-11 16:36:14 UTC
From: Dan=Senie%Eng%Banyan@Thing.banyan.COM
Message-ID: <9209111634.AA14987@ucsd.edu>
Source record: 285499

One case where I use PL259s on 9913 is when connecting to an antenna which has an SO239 connector. It doesn't seem like the impedence bump is going to be any worse using the PL259 versus using an N connector and an adapter.

In my particular case I have this configuration at 6 meters on a ringo, and on a diamond X200. While I would prefer antenna manufacturers use N connectors, this is not reality, so I compensate.

>Randall Rhea

Randall, these are in fact fine rigs, but are not what the original poster was looking for. The price-class asked about would have included the IC-765, not the 735.

Further, the 725, 726, and 735 are NOT the best choices for RTTY or AMTOR. In fact, the IC-751A is a fairly good choice for these modes, but is a dated rig.

The TS850 and the FT990 are both good choices for the usual modes (CW and SSB) and the digital modes. We have an FT990, primarily because its control structure is much cleaner and its filtering options are better (IMHO).

For RTTY, AMTOR and other digital modes, the ability to use true FSK, rather than AFSK is important. This allows the use of the CW narrow filters on RTTY, so that a 500Hz or even a 250Hz filter can be run. Since RTTY is less than 250Hz wide (in terms of the portion actually used to receive) The use of the narrow filters works well. During contests the filters are a must, and on 20 meters anytime they are a help.

Don't get me wrong, it is quite possible to operate these modes with AFSK, and I have done it many times, but it takes its toll on you.

Jeff, if you have additional questions about these different rigs, I'd be quite happy to answer them.

This is in reference to the current thread about someone buying an Alinco 580T who did not have a license.

Given that an individual may go into a gun store and purchase a rifle, shotgun, or pistol, and not need to provide any proof of their ability to safely handle, shoot, store, and understand their weapon, then the idea of a person absolutely having a license to purchase a rig is sort of trivial.

Just my 2 cents.

Well, 20 M band should mean roughly 10 M of wire. For 10 M band you'd need 5 M wire...

> If you own your own home and
> have space, fine. If you need a compromise ant then a vert
> dipole MIGHT be an answer.
[If that's the answer - what was the question? :-]

I can't see how you would be able to bring up 10 meters on wire (protecting the lower end so that no animal or human can touch it), being at the same time unable to put an inverted-V... Even 5 meters... Am I missing something?

Regards,
Uri.

Sorry guys just don't buy this arguement and keep hearing it over and over.
It's the old high margins versus market share concept. Apple computer went
with high margins and the PC's went with market share. Interesting to note
who has the greatest share of the market. The big boys are selling BMW's
and no one is selling Volkswagens. It's the same concept of people saying
with a straight face that 1200 baud packet modems are worth $120! Also don't
miss the point that business should do their best to make the most profits.
Hence the sky high prices on everything from packet modems to transceivers.
As long as the market is dumb enough to pay those prices and even worse
having people trying to defend them, they deserve those profits.

73!

The admonition not to set lead-acid batteries on the ground is sure a new one for me. Maybe somebody left a conventional car battery setting outside in the weather and it got rained on. The water could have leaked into the cells through the vents and contaminated the electrolite with dirt or maybe enough water might have landed on the top of the battery to make a conductive path between the posts, but I can't immagine, at all, that the composition of the surface on which the battery sat would have anything to do with anything.

Ok, than why is it that nobody worries much about the car batteries IN THE CAR?
Surely the average concrete floor is not as cold as outside (at least here in
NJ) in the winter.

>TS-850s for sale, often at very low prices considering the
>youth of this rig. Question 1: Why are so many people selling
>off their '850s? Is there something wrong/awkward/dissatisfying
>with it?

The number one reason that I've seen has been the FT-990. Most ex-850
owners go to the FT-990. Why? Most attribute the "digital" filter
(really just a switched cap filter), but I suspect that a lot of folks
just like to try new radios every year or so.

>Question 2: What was wrong with the '950? I gather that it
>was not very well-received despite good lab specs. What was
>the problem, exactly?

The 950S was no better on the spec sheet than the 940S. There's one
for sale in our area right now for $2200. The 950SD had all the
options installed, filters, TCXO, etc., but the DSP worked only on
transmit. There were also a few ECO's which came out on it, and
I seem to recall that the output signal was less than stellar
spectrally. After a year or so on the market, sales fell off to
nearly nothing.

>
>Question 3: What is really new in the TS-950SDX? Are the "changes"
>real or cosmetic? Of course, this is related to #2.

The 950SDX is a big-time improvement over the 950SD. DSP now works
on receive as well as transmit, and the parameters are configurable
from the front panel. The set-up menu has its own dedicated button
which means that you don't have to do the much hated "hold this button
while you turn on the power" exercise. You can change a lot of parameters
on the fly such as LPF cutoff, HPF cutoff, various frequency offsets,
pitch settings and the like. The menu's are spelled out alphabetically
(but with 7 segment characters - eccch!), and you need rely much less
on the manual now.

The output stage in the 950SDX has been completely redone and uses
power MOSFET design instead of the older bipolar transistors. The
950SDX also allows you to specifically choose receive filters for
the sub-receiver, something that was missing in earlier models. The
big complaint that I hear about the 950SDX versus the FT-10000 is that

the 950's sub-receiver is still restricted to the same band as the
main receiver. On the FT-1000, the sub receiver can be in any band.

The bottom line is that the 950SDX represents almost everything the 950S
should have been the first time around. The experiences and suggestions
learned from the earlier model were then incorporated into the new one.
Sales have picked back up and so far everyone I've talked to who owns
one is quite pleased.

It's still a dead heat popularity race between the FT-1000 and the
TS-950SDX. Personally, I'd like to buy the 950SDX myself but I'm just a
couple of thou short at the moment (current retail price is about $3600).

>> a 'good service' story deleted
>
>
>The 850 does have its flaws.

Ok, I'll jump in here with my TS-850 story:

The biggest problem I've had with mine is that when I use the 2.7 KHz cascaded filters, I can hear a bit of the unwanted sideband when tuning across zero beat. It's a problem which several radios had, and one which does not appear on new units that I've tried. To see the problem, first set the mode to CW and both filters to 2.7. Next, find a moderately strong (S-5 or more) CW signal and set the tuning speed to FINE. As you tune clockwise to zero beat everything sounds fine. When you tune a little farther past zero beat, the signal starts coming up again, however at a much lower level. The problem does not appear at all when the 500 Hz filters are selected.

I called Kenwood and the service tech said that "He'd heard of that somewhere" and that "he'd get back to me". He never called back... Yes, I agree that Kenwood needs a kick in the butt for their service department.

Another questionable "problem" is that many users have a good deal of trouble when they first connect a TNC via the rear 13 pin plug. The usual complaint is a large amount of RF feedback and distortion whenever they transmit. After a fair amount of troubleshooting I concluded that all grounds in the 13 pin plug are not equal (see the schematic), and that some of them snake furiously around inside the radio. One of the grounds is designed to be specifically an "audio ground" and it is terminated somewhere near the front panel mic connector after having entered through the rear interface. There are other grounds which run directly to the frame. In the end, my solution was to tie a ground strap to the TNC, and all of the problems went away.

I found out early on that you can't use 500hz filters with AFSK. Sound odd? Yes it does. But the reason is that the AFSK offsets of 2100+ HZ fall outside the 500Hz passband which is centered around the carrier. The solution: I hooked up the tnc (MFJ-1278) in direct FSK mode where the receive passband is automatically moved to account for the difference. Using direct FSK I can use both 500 Hz filters all day long.

Overall I'm still quite pleased with the radio. Despite the unwanted sideband problem on wide CW, I feel that it's still a top shelf receiver. I'm going to ping Kenwood again today for some sort of answer. Incidentally, I've never had a bad signal quality report either. For the price/performance - and even more so on the used ones, it simply can't be beat.

CBC doesn't give origination info because they're simulcast everywhere. At signoff, CBC (in Vancouver, anyway) includes transmitter location and channel info on all the repeaters. It's kind of a nice piece of graphic work, like a weather map.

==========
Sorry to use this thread to introduce a related one, but...

I wonder what the market would be for a dual band rig pairing 2 meters and 6 meters. Just like many years ago when the (now traditional) Techs came along and very adequately populated the 6-m band, there are many of the new techs (both nocode and traditional) who are interested in six meters, at least in these parts.

Japanese radio manufacturers are not filling this need, if indeed there is one.

It would be quite risky for ANY company to stick its neck out on a venture like this, but it could be a super coup.

Two or three weeks? That's hardly a useful test. And if you only
used two batteries, it's not very scientific.

In my experience with used motorcycle and car batteries, the ones that
sit on the concrete floor tend to break down or calcify faster than
the ones sitting on a wood bench, all other things being equal. I
have to admit I didn't bother to chart how the batteries were used in
an earlier life, or make daily observations, but I know the changes I
observed happened over a much longer period than two weeks.

2545. Log Program for MAC - avail via FTP ??

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-11 21:31:02 UTC
From: brucec@tekgen.bv.tek.com
Message-ID: <1251@tekgen.bv.tek.com>
Source record: 285523

Well, I feel like I've made an honest attempt to
find a MAC public domain or shareware program
that does logging (QSL's etc) on the anonymous
FTP archive sites. I haven't found anything.

Does anyone know of such a program and if so
is it available via FTP? From where? What's the
path? What's the Internet address?

If that fails, does anyone know of such a program
available via any other means. This includes retail
pruchase. If so, whats the name of the program,
and where is it available.

Thanks!

*----
I've purchased a few radios that I couldn't legally operate to their
fullest extent with the license class I held at that time. Some
people don't use every feature of their new equipment. Others might
consider it good incentive to upgrade. Still others might just want
it for modification or as a source of parts.

If I felt the radio would be used in a way that would interfere with
legitimate services, or be put into CB use, I wouldn't sell. Otherwise
I don't consider it my business. I buy a lot of surplus commercial
radio equipment. Nobody has ever demanded that I be licensed to use
it before I buy it.

2547. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-11 21:46:16 UTC
From: tkelso@afit.af.mil
Message-ID: <1992Sep11.214616.24752@afit.af.mil>
Source record: 285437

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.misc. This week's elements are provided below.

2548. RFI Shielding

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-11 22:08:00 UTC
From: afpauls@lims01.lerc.nasa.gov
Message-ID: <11SEP199217084340@lims01.lerc.nasa.gov>
Source record: 285516
Cross-posted to: sci.misc,sci.engr,sci.electronics,rec.radio.amateur.misc

I have an application where the keying of hand held radio (160 MHZ) is causing an unacceptable disturbance in the signal coming from a position transducer. The position transducer has a signal conditioner mounted remotely from the sensor head. The interferance is picked up at the signal conditioner. If feel that the best way to solve this problem would be to mount the signal conditioner in an RFI proof enclosure. Here are my questions.

Would an RFI proof enclosure work?

Does any company make an enclosure? (I would need a 6" x 6" x 4" box)

Could we make an EMI proof box using some conductive gaskets? (We tried a regular NEMA 1 box and it didn't seem to help)

Are there any better solutions?

Any help or insight would be appreciated.

I'll take one as long as its all-mode and reasonably sized (for
mobile use).

I have moved a number of times over the last 18 years, and when I open a new account, I merely order the checks starting with a higher number (i.e. start at 1000 rather than 100), it eliminates a lot of unwarranted prejudice. I think it was Utah where the banks print the month and year your account was opened on the checks, but it seemed people eyed the check number more often.

In California they are issued by the DMV and except for passing a driving test
they are no easier to get than a driver's license. In appearance they are
identical to licenses, except for some fine print. I have one.

End it? You can't do that: Doug DeMaw is writing an article on using your Garage floor to power your QRP rig during fieldday!

Every time I have opened a checking account, they have asked me what
number I wanted the checks to start with. Usually I pick a number
in the thousands.

Source record: 285527

> Is it lawful to use ham equipment in other services?

With the exception of certain rare exceptions like CAP, MARS, and
RACES, no.

> 4 watts for am, it would be illegal to trans mit in CB channels with
> a ham HF rig. That only a type accepted cb transmitter is accepatable.

This indeed is the case. The radio must be type accepted.

> Assuming a 2 meter rig can transmit in the Marine radio bands is it legal
> to use to for communicating with other boats? Or is another special liscense
> required(I thought I read it was). Even if a liscense is required
> do I have to use a type accepted marine radio like I do for CB?

No, the radio must be type accepted. A license is required for marine
use as well (even for type accepted radios).

In general, hams are the only ones who can get by with using radios
that are not type excepted (there are also real experimental licenses
as well). In addition, you won't find a radio that is type accepted
for one of these other services and coincidentally a ham radio because
as of late, the radios must not be user settable to out of band
operation (though, a manufacturers idea of what this means is pretty
open, ICOM commercial radios for example have a magic programming
mode).

> Lastly please post the frequency for marine channel 16(emergency channel),
> since surely it would be licit to transmit here in an emergency situation
> with a 2 meter ham rig.

In an emergency, you could use spark gap if you had to. I don't have
any idea what freq. channel 16 is though.

SOLAR BULLETIN

12 September, 1992

Monthly Reports for August 1992

/\

MONTHLY REPORTS OF SOLAR GEOPHYSICAL ACTIVITY FOR AUGUST ARE NOW AVAILABLE:

A new monthly report is being provided. A complete summary of all solar regions numbered during the month of August along with all associated region statistics can be found in the file "augrgn.doc".

The monthly reports of solar and geophysical activity for the month of August 1992 are now available through anonymous FTP from the following sites:

xi.uleth.ca <--> 142.66.3.29 <--> "pub/solar/1992"
nic.funet.fi <--> 128.214.6.100 <--> "pub/dx/solarreports" and subdirs
solar.stanford.edu <--> 36.10.0.4 <--> "pub/1992" and subdirectories

Also, preliminary monthly ionospheric data are available from either of the last two sites above (nic.funet.fi or xi.uleth.ca). Data reported includes M(3000)F2, foF2, MUF(3000)F2, and TEC.

The files to get are:

NEW"augrgn.doc" - Summary of All Solar Regions for the Month of August.

"augflr.doc" - Summary of Solar Energetic Events for August 1992.

"augmag.doc" - Summary of Global Geomagnetic Activity for August.

"iono-aug.zip" - Summary of Ionospheric Data, compressed using ZIP.

"iono-aug.zoo" - Summary of Ionospheric Data, compressed using ZOO.

"iono-aug.tar.Z" - Summary of Ionospheric Data, TAR'd and COMPRESSed.

"augtec.zip" - Summary of Global Total Electron Content (TEC), compressed using ZIP.

"augtec.zoo" - Summary of Global TEC, compressed using ZOO.

"augtec.tar.Z" - Summary of Global TEC, TAR'd and COMPRESSed.

"sgdb-aug.zip" - Archive of all Daily Solar Geophysical Data Broadcasts (SGDBs) for August using ZIP.

"sgdb-aug.zoo" - Archive of all SGDBs, compressed using ZOO.

"sgdb-aug.tar.Z" - Archive of all SGDBs, TAR'd and COMPRESSed.

** End of Bulletin **

2557. What's the difference....?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-12 01:46:21 UTC
From: urbina@novax.llnl.gov
Message-ID: <1992Sep11.174621.1@novax.llnl.gov>
Source record: 285430

What's the difference between spread spectrum and frequency hopping ?
Also, what is meant by "BURST" transmission ?

Any other brief descriptions of Interception Countermeasures now being used would be appreciated.

Thanx.
Guy

Urbina@Novax.llnl.gov

2558. Hurricane hits Hawaii

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-12 04:07:02 UTC
From: wa2ise@cbnewsb.cb.att.com
Message-ID: <1992Sep12.040702.16400@cbfsb.cb.att.com>
Source record: 285434

Just saw on ABC's Nightline About ham radio operators being the only
form of communications with the island of "Kauai". According to
the report, the phones are out, and the only contact is with hams
with VHF radios. Must be with adjacent islands.
Nightline interviewed an amateur (think his call WD8JDY, was in backround
in his what looked like a HF station), and he told of what he had monitored
about the hurricane in Hawaii (the stuff above). And that a ham saw
a house loose its roof.

Looks like good publicity for amateur radio. Looks like someone (ARRL?)
did some good work getting the word to the news media that hams are
useful for some emergency communications.

2559. "Re: 50/144 Dual Band Rigs"

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-12 04:12:14 UTC
From: rc@cmr.ncsl.nist.gov
Message-ID: <9209120413.AA17935@cmr.ncsl.nist.gov>
Source record: 285435

50/144 MHz dual band rigs have been available for many years. The one which first comes to mind is the Yaesu FT-726, introduced perhaps 8 years ago. A few years ago it was replaced by the FT-736. These are actually 3-band rigs; having a choice of modules. The 144 MHz module is always supplied. For the 726, the other choices were 50, 432, 440, and HF (15, 12, 10 m). For the 736, other modules include 50, 432, 440, 1296 MHz.

These rigs are NOT small, but my 726 has nice features like passband tuning, a second channel for duplex satellite operation, dual VFOs, etc.

2560. What's been happening with amsat's mail?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-12 05:16:23 UTC
From: clark@tomcat.gsfc.nasa.gov
Message-ID: <24304@tomcat.gsfc.nasa.gov>
Source record: 285436

Let me answer once to all of those who have wondered where the AMSAT material has been the past couple of days: The amsat.org host in San Diego suffered a massive case of catatonia on Tuesday. I haven't got details, but Brian, WB6CYT reported that he couldn't even get it to boot.

The host we had been using for amsat.org was an antique SUN 2/220 that Brian had built out of hios junk box. We had intended to replace it with a more modern host and had selected a SUN 3/60.

We had placed the order with a firm in the San Francisco area who had brand new 3/60's at a very attractive price. The hardware was supposed to be shipped from the Bay Area direct to Paul, KB5MU in San Diego. Alas, on Wednesday it was delivered to the AMSAT office in Maryland. The vendor had screwed up. Martha and Paul embarked on heroic efforts to get the hardware from the Atlantic to the Pacific coast.

Today Paul got the engine to Brian, and amsat.org is again QRV, now running the new CPU.

For those of you who sent messages asking why they weren't receiving messages, or why something had bounced, now you understand. It may take a day or two for the problems to get sorted out.

I just resent N3FKV's two-line elements for this weekend. They were caught in a problem when they were sent the first time.

73, Tom

Well, not that I have any idea why, but I do have this lead-acid
battery that I was keeping in the basement, on cement, for a rainy day. I
noticed that every time I checked it it was weak and I figured that the
thing was no good because it couldn't stay fully charged (with no load) for
even a week or two). When I started powering my radio from it and moved it
onto carpet, I once ran it for 3-4 weeks with no degredation in voltage
during transmit. I ended up charging it for fun, not because I needed to.
I can't explain it, I just observed it. I didn't know about this myth
until I saw it here.

>1" aluminum box section. However, I can't figure out how one is
>supposed to feed this thing. There is no discussion I can find on
>how this might be done.

See page 18-10 near the bottom of paragraph 2. It says, "Generally speaking, a balanced feed system is preferred in order to prevent pattern skewing and the possibility of unwanted sidelobes that result from unbalanced feed systems." So there you have it. For the insulated boom version, a folded dipole driven element with a 4:1 balun would be a good choice, fed with CATV hardline. For the plumber's delight version, a T match will fill the bill. See Chapter 26 for information on how to build these.

>The second antenna is a 15 element Yagi, with a boom length of 117"
>(9.75 feet). I understand how to feed this, but don't know what the
>implications of either shortening the inter-director length is, or
>just eliminating two of the directors would do. I know it would obviously
>affect the gain and F/B ratio, but by how much?

Answering that question would require computer simulation with one of the antenna design programs, or experimentation on the antenna range. In general, monkeying with the spacing is more likely to cause degradation of main, and side, lobe performance than simply dropping a couple of elements off the end.

>Can I use the feed technique from the second antenna to feed the first?
>Also, in the feed technique for the second, they mention using "Steatite"
>standoffs. I'm not an antenna expert, but I would assume that these
>are insulated, seeing as the feed line is attached to these standoffs,
>and the otherside of the standoff would be ground.

Yes, you can use this T match design for the driven element of any of the NBS antennas. Steatite is a trade name for a type of ceramic standoff insulator. Come over and stare intently at one of my boomers to see how to build a driven element like this.

Matthew, most banks will allow you to start your check numbers at any point. When last I changed banks, I started my new account at 5,312 to maintain continuity in my accounting. Any competent check forger knows this too, so being concerned about low check numbers only catches the amateurs.

A couple of tongue-in-cheek posts got what few brain cells I have left working and I do have a question for the group.

I live in an apartment and have curtailed any HF operating because of terrible RFI generated by color TVs in the area, my own included. I'm not talking about the 3.58 mHz oscillator (or whatever the freq is), I'm talking about s9+ garbage all over the spectrum. I contacted the manufacturer of my own set and was told, basically, 'too bad'. Now if I remember right, there is something in FCC regs (part 19????) which states ".... No device shall cause interference to nearby receivers of good engineering design" or something like that. Am I getting old/senile and just don't remember the regs (it was about 30 years ago that I studied all that stuff) and are the manufacturers just ignoring the regs? Also, if anyone has a cheap and easy cure (I can't tell everyone to not watch TV, much as I would like to), I'd love to hear about it.

73,
Tom

>
>What's the difference between spread spectrum and frequency hopping ?
>Also, what is meant by "BURST" transmission ?
>
>Any other brief descriptions of Interception Countermeasures now being used
>would be appreciated.

Large topic. Hopping is generally lumped in with other spread spectrum methods, though there are different advantages and disadvantages with hopping than with direct sequence spreading. Burst is a different system completely. If the hopper's hop rate is faster than the symbol rate, many of the same advantages of PN spreading are obtained while placing higher instantaneous power on the current channel. Hopping, particularly slow hopping, is also often easy to implement by modifying existing narrow band equipment.

Basically, hoppers take a narrow modulated carrier and rapidly change it's center frequency. So at any given frequency you have a full power signal present occasionally for a very brief period.

Pseudo-noise direct sequence spreaders work differently. The carrier is fixed in frequency, but is modulated very broadly by a PN sequence that is XORed with the data symbols. Again, you want the PN modulation to be at a much higher rate than the symbol rate. Since the power of the carrier is spread widely across many channels, any given channel has very little signal power present. Since the power is correlated, it can be despread in the receiver and recovered.

Burst is simply a narrow modulated carrier using a very high data rate to transfer the message in a very brief time.

Various experts will probably correct the sloppy explainations above.

Source record: 285452

My orignal intention of making the post was to alert the area hams to this individual. This due to the fact that several more hamfest were advertised in this tri-state area.

Some how I did not convey the real intent of my post. The person passing these checks was very professional, my friend who accepted the check for his gear was an experienced bank person, and was made to feel confortable by the person's demeanor.

I agree with statements with regard to **Offically** issued ID's by any state government. They are issued in the same manner here in Ohio. I also concur with the opinion with regard to the FCC license information, in this case computer equipment was sold and it would not be a consideration during the sale.

Finally, I have noted the State issued drivers licenses and ID contain more accurate than the FCC issued licenses in most cases, based upon my law enforcement experince and having been a ham since 1968.

Because this country is in the midest of an economic recession the best advice to be given is that the old sarge on Hill Street Blues used to give to the officers at roll call...."Be careful out there".

/\

SOLAR BULLETIN

12 September, 1992

Monthly Reports for August 1992

/\

MONTHLY REPORTS OF SOLAR GEOPHYSICAL ACTIVITY FOR AUGUST ARE NOW AVAILABLE:

A new monthly report is being provided. A complete summary of all solar
regions numbered during the month of August along with all associated region
statistics can be found in the file "augrgn.doc".

The monthly reports of solar and geophysical activity for the month of
August 1992 are now available through anonymous FTP from the following sites:

xi.uleth.ca <--> 142.66.3.29 <--> "pub/solar/1992"
nic.funet.fi <--> 128.214.6.100 <--> "pub/dx/solarreports" and subdirs
solar.stanford.edu <--> 36.10.0.4 <--> "pub/1992" and subdirectories

Also, preliminary monthly ionospheric data are available from either of the
last two sites above (nic.funet.fi or xi.uleth.ca). Data reported includes
M(3000)F2, foF2, MUF(3000)F2, and TEC.

The files to get are:

NEW"augrgn.doc" - Summary of All Solar Regions for the Month of August.

"augflr.doc" - Summary of Solar Energetic Events for August 1992.

"augmag.doc" - Summary of Global Geomagnetic Activity for August.

"iono-aug.zip" - Summary of Ionospheric Data, compressed using ZIP.

"iono-aug.zoo" - Summary of Ionospheric Data, compressed using ZOO.

"iono-aug.tar.Z" - Summary of Ionospheric Data, TAR'd and COMPRESSed.

"augtec.zip" - Summary of Global Total Electron Content (TEC),
compressed using ZIP.

"augtec.zoo" - Summary of Global TEC, compressed using ZOO.

"augtec.tar.Z" - Summary of Global TEC, TAR'd and COMPRESSed.

"sgdb-aug.zip" - Archive of all Daily Solar Geophysical Data
Broadcasts (SGDBs) for August using ZIP.

"sgdb-aug.zoo" - Archive of all SGDBs, compressed using ZOO.

"sgdb-aug.tar.Z" - Archive of all SGDBs, TAR'd and COMPRESSed.

** End of Bulletin **

Also owning a DJ580-T myself I notice a similar problem with the Tone
Squelch in repeater usage. While I have no trouble opening up the repeater
I find the the conservation tends to come off and on even though the
Smeter has a FULL reading. This happens whether or not I switch bands.
Sometimes the audio opens up, sometimes it dosen't. I thought I followed
the instructions in the manual, but I could be wrong.

Could it be that the repeater dosen't always properly re-trans the
sub audible tone, and that maybe it is getting clipped?

I thought that the battery save feature might be affecting this, but turning
it off seems to make little difference.

I have moved a number of times over the last 18 years, and when I
open a new account, I merely order the checks starting with a
higher number (i.e. start at 1000 rather than 100), it eliminates
a lot of unwarranted prejudice. I think it was Utah where the
banks print the month and year your account was opened on the
checks, but it seemed people eyed the check number more often.

To: info-hams@ucsd.edu

This is a reminder to all UK participants in this year's Jamboree-On-The-Air
that you must register yourselves with Scout Headquarter BEFORE the event.
This will enable you to gain the pre-JOTA newsletter, gain valuable resource
material and information on other stations and become part of the annual
statistics.

>a person absolutely having a license to purchase a rig is sort of trivial.
*----
I've purchased a few radios that I couldn't legally operate to their

fullest extent with the license class I held at that time. Some
people don't use every feature of their new equipment. Others might
consider it good incentive to upgrade. Still others might just want
it for modification or as a source of parts.

If I felt the radio would be used in a way that would interfere with
legitimate services, or be put into CB use, I wouldn't sell. Otherwise
I don't consider it my business. I buy a lot of surplus commercial
radio equipment. Nobody has ever demanded that I be licensed to use
it before I buy it.

Subject: Using Ham Equipment in Other Services
To: info-hams@ucsd.edu

> Is it lawful to use ham equipment in other services?

With the exception of certain rare exceptions like CAP, MARS, and
RACES, no.

> 4 watts for am, it would be illegal to trans mit in CB channels with
> a ham HF rig. That only a type accepted cb transmitter is accepatable.

This indeed is the case. The radio must be type accepted.

> Assuming a 2 meter rig can transmit in the Marine radio bands is it legal
> to use to for communicating with other boats? Or is another special liscense
> required(I thought I read it was). Even if a liscense is required
> do I have to use a type accepted marine radio like I do for CB?

No, the radio must be type accepted. A license is required for marine
use as well (even for type accepted radios).

In general, hams are the only ones who can get by with using radios
that are not type excepted (there are also real experimental licenses
as well). In addition, you won't find a radio that is type accepted
for one of these other services and coincidentally a ham radio because
as of late, the radios must not be user settable to out of band
operation (though, a manufacturers idea of what this means is pretty
open, ICOM commercial radios for example have a magic programming
mode).

> Lastly please post the frequency for marine channel 16(emergency channel),
> since surely it would be licit to transmit here in an emergency situation
> with a 2 meter ham rig.

In an emergency, you could use spark gap if you had to. I don't have
any idea what freq. channel 16 is though.

Subject: What's the difference....?
To: info-hams@ucsd.edu

What's the difference between spread spectrum and frequency hopping ?
Also, what is meant by "BURST" transmission ?

Any other brief descriptions of Interception Countermeasures now being used
would be appreciated.

Thanx.
Guy

Hi! netters,
I am planning to buy a portable (like walkie-talkies) cb radio.
Since I have a budgetary problem , I am looking for the chepest cb radio
available in the usa. Also the cb has to be powerful and smallest in size
(I really hate those huge ones). If any of you have any informartion
regarding the best manufacturer of cb's and their address then please
e-mail me at "sih@wam.umd.edu" with their address, phone number (800
number preferable) and their price . My budget is $ 150-200 . I really
cannot afford to pay a whole lot because I am broke after paying the
tuition for the fall semester ;(. Also is there any mail order catalog for
cb radios? Plese let me know that too (i.e. how to get my adress listed on
the mailing list).

Thank you all.

Shahed.

I hope someone out there can establish communication with Kauai.
Any help is appreciated.....

Dear Sirs,

My brother and his wife are residents of Kauai. In the wake of the
hurricane, my family has been unable to contact them and worry and
stress are high.
His name is Charles Thomas Stepp Jr. He is the Manager of the Safeway
bakery and his wife, Denise Stepp, is a Nurse at Wilcox Hospital.

I ask that if there is some way to contact them, please let me know.

If I have mailed this improperly, I apologize.
Thank You very much,
Todd Stepp

2580. How far does 4 watts (CB) go?

I recently purchased two hand held CB transceivers. They are advertised to put out 4w of signal and have ~4-5 center loaded antennas. My question is how far should I expect to be able to communicate using these units? I am assuming a typical flat suburban environment with both units at ground level. In my trials so far I found less than 1/2 mile range. Is this reasonable or not?

Also, what could I do to improve the situation. Would a car mounted antenna help much (they have an outlet for an external antenna)?

thanks,

bob beach

My 4 watts on 27Mhz went over 2000 miles, and I have QSL's from England/Ireland
to prove same. Seriously, if we're talking just ground wave here, it depends
a lot on terrain, and the elevations above said terrain of the transmitters.

Given a reasonably flat terrain, I would say up to 100 miles.

WAKE STUDENTS TO TALK TO SPACE SHUTTLE ASTRONAUTS
LIVE
DURING SEPTEMBER SHUTTLE MISSION

Several Wake County school classrooms will sound more like Mission Control on Sept. 16, when three students have the chance to talk live to Space Shuttle Mission Specialist Jay Apt aboard the orbiter Endeavor. The communications will be handled on an Amateur Radio link provided by the Raleigh Amateur Radio Society. Wake County is one of three school systems in the US, and only six in the world, selected by NASA to participate in this mission's SAREX (Shuttle Amateur Radio EXperiment).

One student each at Cary High School, East Wake Middle School, and Effie Green Elementary School will be selected to ask the astronaut a brief question, and receive a live reply, during a 5 minute communications "window" as Endeavor passes over the eastern U.S. Hundreds of students will be watching or listening as the contacts take place, capping off a week of space-related activity at the schools.

The goal of SAREX is to increase awareness of science and technology among young people worldwide. Geography, mathematics and physics become real, practical sciences as students learn to plot the shuttle's path and calculate the time of the narrow radio window. The window is brief because the Amateur Radio communications are "line-of-sight," and with an orbit about 150 miles above the earth, Endeavor can be "seen" from Raleigh for only about 9 minutes. The SAREX radio antenna, in a shuttle window, will be blocked by the spacecraft body during the second half of the pass, leaving only about 5 minutes to complete two-way communications.

Endeavor is scheduled to launch on Saturday, Sept. 12, between 10:23 a.m. and 2:17 p.m. EDT. The orbiter will be in position for our contact 95 hours and 4 minutes later, or Wednesday morning, Sept. 16th if the launch proceeds on schedule. A backup date has also been set about 24 hours later if the first contact "window" must be missed.

The SAREX program was developed jointly by NASA, the American Radio Relay League (ARRL), and the Amateur Satellite Corporation (AMSAT). This will be the seventh shuttle mission featuring Amateur Radio communications. Two licensed Amateur operators will be on board: Jay, whose Amateur callsign is N5QWL, and the first Japanese astronaut, Payload Specialist Dr. Manoru Mohri, whose callsign is 7L2NJY.

SUMMARY AND CONTACTS

DATE: Schedule is subject to change based on the actual launch date and time!
Launch: Scheduled for Saturday, Sept. 12, between
10:25 a.m. & 12:55 p.m. EDT.
Contact Window: 3 days, 23 hours, 4 minutes (95 hours, 4 minutes) after launch. If launch is on schedule, contact will be made Wednesday morning, Sept. 16.

LOCATIONS: Cary High School auditorium (or Media Center).
East Wake Middle School Media Center (Library).
Effie Green Elementary School Media Center (Library)

2585. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-13 00:56:29 UTC
From: tkelso@afit.af.mil
Message-ID: <1992Sep13.005629.15851@afit.af.mil>
Source record: 285471

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

I dislike this as well, partially because I live in fear me or the xyl will
use an icom cord on the thing (same size, reversed polarity), partially
because all the metal in my car is negative ground.

There is no need to worry about the ground on the antenna. The power
socket floats and the antenna ground is negative.

>
>AL N1AL

Depending on how serious the problem is, a simple "choke" balun, i.e., a coil of coax somewhere before your rig, MAY be sufficient. I use an antenna tuner in the shack, the "balanced balanced" tuner from QST a while back, which is a balanced L network with a choke balun on the input. You just wind about 20 feet of coax on a 4 inch form. You might even get by with just coiling up the coax. I've used random wire tuners and such since my early days, and since putting in this system with its coax balun, have had far, far fewer problems with RF in the shack, even with open wire lines. Try this solution even for other RF problems.

2593. hams helping with Iniki emergency

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-13 13:06:28 UTC
From: grady@btr.BTR.COM
Message-ID: <7989@public.BTR.COM>
Source record: 285395

What can individual hams do do help out in the communications emergency resulting from Hurricane Iniki? Plenty. And _you_ get to set the time and amount of aid to fit into your usual schedule.

One way of helping is simply to take outgoing "health & welfare" messages that can be delivered via a collect call. Get on your favorite HF band with the likelihood of propagation to Hawaii from where you live. For example, from the Western United States, you might listen at a beam heading of 255 degrees, and on, say, fifteen meters, call CQ as: "CQ CQ CQ for Hawaii outgoing health & welfare traffic. Collect calls only. This is KD6ETH calling CQ."

Repeat call as needed, whenever and wherever you think you might be heard by a Hawaii ham.

After getting the name and phone number of the stateside recipient, the name of the third party wishing to send the message, and the message itself (which you may wish to restrict to the "I'm OK" type, depending on your time). Repeat as needed.
After you accept whatever number that you have time to handle at that time during that session, you sign and make a best attempt at delivery. That's it. You helped in the Iniki emergency. Congratulations!

You can choose to take one message, or a hundred. You don't have to listen to a "net frequency". You don't have to wait for a tedious net roundtable to get to your turn. You can do it now, and you can be 100% responsible for the result.

2596. Advice Needed: CPU putting out too much RF

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-13 15:49:40 UTC
From: jonathan@nova.next.nd.edu
Message-ID: <1992Sep13.154940.5801@news.nd.edu>
Source record: 285379

I need some advice. I live in an apartment (I heard that sigh!) but that is only part of the problem. I can actually work the local repeaters just fine even with my Kenwood TH28A on a rubber ducky. The problem is as soon as I power up my computer I get too much RF interference. Basically it causes enough "noise" that no matter if the squelch is full on the radio is open. It is fine if the station is using CTCSS but the local repeaters don't. What options do I have? I would love to simply mount the antenna on the roof but regulations don't permit that (although I may try out of desperation). Is there any place that makes RF shielded CPU cases? It is not the monitor because I completely unplugged power and the cable from the CPU and the problem didn't change. Thanks.

I'll see what I can do... just heard AH6CP on UHF, he has managed to get the Kauai 147.040 RACES repeater back onto the statewide repeater network. Good news for RACES / Civil Defense! But Health and Welfare traffic is still low-priority right now. First they have to get food, water, generators, and housing over there.

Some stuff I have heard from various sources:

nearly 90% of the telephone poles are down

1/3 of the homes have serious damage

trunk lines to Kauai are back up as of Saturday 2100 UTC, but since there aren't many utility poles standing, the central office has little "fanout" to the rest of the island. The EOC has no phone lines yet.

Main RF site for the island is a total loss -- tower blown over the side of the mountain!

NO electricity on the island. (Will they have to use a nuclear submarine to restart them? That's what was done 10 years ago after Hurricane Iwa.)

Look for Hawaii stations on 14.268 daytime, 7290 and 7088 nights.

Aloha de KJ9U/KH6

P.S. the packet BBS on Kauai is NH6HF.HI.USA.OC.

Nice to see the internet link up again!

2599. RACES Bulletin #239

CA STATE OFFICE OF EMERGENCY SERVICES (W6HIR @ WA6NWE.CA)
2800 Meadowview Rd., Sacramento, CA 95832 (916)262-1603
Landline BBS (FIDO) open to all: (916) 262-1657
RACESBUL.239 DATE: Sep. 14, 1992
SUBJECT: MGT - Wild fire volunteers - Part 2/2

5. Assist CDF in communications during fire emergencies.
6. Inspect rural homes to advise homeowners of proper vegetative clearance around structures and safe incinerator standards.
7. Inspect equipment such as chain saws, lawn mowers, and tractors to see that they are equipped with legal spark arresters and in fire safe conditions.

Volunteers may apply time spent working in the VIP program toward experience needed to meet entrance requirements for future forestry examinations. Citizens performing voluntary fire prevention duties are covered with Workers Compensation Insurance. Unreimbursed expenses incurred may be considered "contributions" for Federal and State income tax purposes.

The VIP Amateur Radio program is an important program in several of California's 22 Ranger Units. Some Amateur Radio operators serve as "shadows" with battalion chiefs and fire information officers. (See Bulletins 161, 164, and 208.) Many VIP communications volunteers are in a RACES unit. The VIP can turn to the RACES for mutual aid support and vice versa. The "radio officer" in a VIP unit is called the "hamco" or ham coordinator. In some counties the county RACES unit and the VIP communicators are one and the same. Both activities have training requirements to assure safety, compliance with the incident command system, (ICS), and commonality of operations and performance.
---Stan Harter, KH6GBX

EOM

RACES Bulletins are archived on the Internet at ucsd.edu in hamradio/races and can be retrieved using FTP.

Kieth Sproul (WU2V or is it Y, one's his, one's his wife) has a Hypercard stack that not only does logging it also controls several different radios (provided you've already got thme connected to the MAC). I'd have to believe that this software is at least shareware (knowing Kieth though, he's just giving it away). I don't know of anyplace that has it on the Internet, but I know Kieth is working on increasing the MAC software component of the Buckmaster CD ROM's (there's a lot of room left over after the call book).

RTTY DX Notes 11 September
RTTY DX Notes for week ending 11 September, 1992 (BID RTDX0911)

Regrettably there may be some difficulty with the distribution of
these notes in the American area this week, due to John TG9VT being in
hospital with pneumonia. But every effort will be made by TG9SO. In
any case the notes will be available from John's box. John should be
back home later in the week.

Our thanks this week go to DJ3IW and the DB0SPC DX Packet Cluster,
I5FLN, T3B, TG9VT, TY1PS, VK2EG, WB2CJL and W2JGR and the Twin Cities
DX Packet Cluster Netwrork. We thank you all for your assistance.
Even though the bands were dead, there was still some useful
information.

Notes of Interest

Regarding Kermadec Island (ZL8), the information is that Bob ZL4DO is not going there as a DXpedition. He is under contract to do some special work which will take about one day. The boat taking him and others of the working party are scheduled to stay around the island for one and half days. As there are no jettys or landing facilities,

everything has to be taken ashore by chopper. Unfortunately there is no guarantee of RTTY operation, though there is RTTY gear on the island. Time to spare being the problem. The anticipated date is the 16th, but that will depend on the weather and the condition of the seas. I am afraid that we will just have to hope for the best.

The Managua Nicaragua YN0TI DXpedition should be on the air from the Central American Convention from 11th September to 16th September. QSL via TI2MCL.

Ron ZL1AMO says that he will be QRV from Chatham Island around the middle of September. He will be there for about a week using the ZL7 callsign.

The team that went to Navassa (KP1) last January hopes to activate Desecheo (KP5) from December 27, 1992 until January 4, 1993. Donations and encouragement go to N0TG.

The QSL cards for the VP8SSI operation have been posted from Japan and should arrive at the QSL managers address this weekend (we hope) then they will be processed and, they hope, in the mail within 48 hours.

There is still some argument about the legitimicy of the operation of DJ6SI/G3. Cards are not, for the moment, being accepted by the ARRL DXCC Desk. We can only await the outcome of the ARRL investigations.

2605. Test your DJ-580T tone squelch (TSQL)!

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-13 19:41:18 UTC
From: mjr@netcom.com
Message-ID: <2yxnfsj.mjr@netcom.com>
Source record: 285384

Considering the mail I got in response to my posting under the subject:
"DJ-580T problem with audio drop out using T-SQL", I thought I would
summarize here as others seem to have the problem as well.

The tone squelch (TSQL) acts like a mute. The audio from any transmitter
not using the proper tone is muted, while RF is not, so you still see
the transmission being received on your S-meter.

But if the transmitter *is* using the proper tone, the squelch should
"open up" in 0.5 seconds or less. My problem (and that of others I've
heard from) is that it takes longer (sometimes 2-5 seconds) which is
unacceptable.

The is a *factory adjustable* setting. Alinco would not tell me how to
do it on my own (if possible at all). If anyone knows, let us know please.
Otherwise, I will send it back eventually...

Thanks to all who replied by mail...

2606. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-13 20:48:27 UTC
From: tkelso@afit.af.mil
Message-ID: <1992Sep13.204827.21832@afit.af.mil>
Source record: 285389

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

STS-47/SAREX Mission Has a "Picture Perfect" Lift-Off!"

The space shuttle Endevour began its second flight today (12-SEP-1992) with a picture perfect lift-off at 14:22:59.974 UTC. This 6 day Shuttle Amateur Radio Experiment (SAREX) mission will provide earth-bound radio amateurs many opportunities to make 2M voice and packet radio contacts with Jay Apt (N5QWL) and Mamoru Mohri (7L2NJY). The packet station call sign will be W5RRR-1.

The following element set is the latest received for the STS-47 mission and should provide for accurate aquisition-of-signal (AOS) times.

AMSAT OPERATIONS NET SCHEDS

HR AMSAT NEWS SERVICE BULLETIN 256.03 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 12, 1992 BID: $ANS-256.03
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule

AMSAT Operations Nets are planned for the following times. Mode B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz and the Mode J/L Nets on a downlink of 435.970 MHz.

Date UTC Mode Phs NCS Alt

19-Sep-92 1830 B 71 WJ9F VE2LVC
26-Sep-92 1445 B 162 VE2LVC W9ODI
3-Oct-92 1830 B 162 N7NQM W5IU

Any stations with information on current events would be most welcome. KITSAT-OSCAR-23 (KO-23) information is of particular interest at this time. In the unlikely event that either the Net Control Station or the alternate do not call on frequency, any participant is invited to act as the NCS.

Slow Scan Television on AO-13

SSTV sessions will be held on UTC Saturdays and Sundays. Mode J on a downlink of 435.980 MHz, and Mode B immediately after Mode J on 145.960 MHz. OPS NETS will take priority so look for SSTV activity immediately after they conclude.

AO-13 TRANSPONDER SCHEDULES

HR AMSAT NEWS SERVICE BULLETIN 256.04 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 12, 1992 BID: $ANS-256.04
TO ALL RADIO AMATEURS BT

G3RUH Provides Current & Future AO-13 Operating Schedules

L G3RUH/DB2OS/VK5AGR *** Future AO-13 Transponder Schedule ***
Mode-B : MA 0 to MA 40 ! from 1992 Aug 17 - Sep 21
Mode-S : MA 40 to MA 50 !<- S transponder; B trsp. is OFF!
Mode-LS : MA 50 to MA 55 !<- S beacon + L transponder
Mode-JL : MA 55 to MA 70 ! This schedule operates
Mode-B : MA 70 to MA 256 ! every orbit, every day.
Omnis : MA 160 to MA 10 ! Blon/Blat 150/0

Mode B users are reminded that at MA 40, the Mode B transponder will be heard to go OFF with a click. Although you will still hear the Mode B beacon, do not attempt to uplink as you will get no Mode B response; however, you could interfere with Mode S. Mode B returns at MA 70.

Note too that this schedule operates every orbit, every day.

QST de G3RUH 1992 Sep 10. Magnetorquing from attitude 150/0 to 180/0 will commence on Sep 20 [Sun] 01:19 UTC, Orbit 3268, MA count 224, and will continue for 6 perigees. Estimated interim attitudes are:

Orbit Blon/Blat Orbit Blon/Blat Orbit Blon/Blat

3268 147/-4 3269 154/-4 3270 160/-4
3271 166/-4 3272 171/-2 3273 176/-1
3274 181/0

Accuracy +/- 5 degrees

The new schedule will be uploaded during Mode L, Orbit 3272. So 3272 (only) will contain two Mode J/L/S sessions: MA 40-70 and MA 130-160.

Magnetorquing is not an exact science, and there is always a possibility of changes to the above plan and of unannounced interruptions to the schedule.

M G3RUH/DB2OS/VK5AGR *** Future AO-13 Transponder Schedule ***
Mode-B : MA 0 to MA 130 ! from 1992 Sep 21 - Nov 23
Mode-S : MA 130 to MA 140 !<- S transponder; B trsp. is OFF!
Mode-LS : MA 140 to MA 145 !<- S beacon + L transponder
Mode-JL : MA 145 to MA 160 ! This schedule operates
Mode-B : MA 160 to MA 256 ! every orbit, every day.

Omnis : MA 235 to MA 30 ! Blon/Blat 180/0

SILVER SPRING, MD SEPTEMBER 12, 1992 BID: $ANS-256.05
TO ALL RADIO AMATEURS BT

AMSAT-OSCAR-21/RUDAK-2: NEW VOICE MESSAGE

RUDAK-2 onboard AO-21 is still running 6 Minutes FM-Repeater (DSP),
3 Minutes voice broadcast and 1 Minute PSK Telemetry (400 Bit/s).

A new voice message was uploaded on Saturday, September 13th with the following contents:

"This is AMSAT OSCAR-21. Greetings to the Russian-Denmark Expedition, which discovered the burial place of Vitus Bering and his team at the Commander Bay near Kamchatka."

(Voice borrowed from DB2OS)

Last year the Russian-Denmark expedition (organized by the Adventure Club of Moscow) has discovered the burial place of the famous Danish explorer Vitus Bering (1682-1741) and his team (8 people) at the Commander Bay. This year the expedition continues its work.

For September 12-14th, a ceremony is planned for the re-burial of Vitus Bering. The Ambassador of Denmark in Moscow is attending this event, together with many journalists and accompanied by Leonid Labutin (UA3CR).

The Island is near Kamchatka, 56 degrees North and 166 degrees East.

Amateur Radio Station 4K4LC with Yuri (UW6LC) as the station operator is active from Bering Island presently and Leo Labutin will join him for a few days. They will also experiment from there with AO-21/RS-14 digi-voice reception and also will try to contact U6MIR in the MIR space station. The HF operating frequency is 14.195 MHz, and the HF station consists of a FT-747GX with 100W of RF output, the antenna is a Cushcraft 12-AVQ 3-band vertical. Please try contact him if you need this rare DX QSO.

[The AMSAT News Service (ANS) would like to thank Gerhard (DG2CV) and Peter (DB2OS) for this bulletin item.]

TO ALL RADIO AMATEURS BT

AO-13 Aids Communication With Hurricane Devastated Hawaii

WD4FAB from Maitland, Florida reported that at the conclusion of the Satellite Operations Net on AO-13, about 18:00 UTC Saturday, September 12, he was called by WH6IC in Kailua on the Island of Oahu. The operator, Steve, said that at his location on the opposite side of the island from Honolulu, the damage from Hurricane Iniki was considerable. He also added that on the island of Kauai, about 75 miles to the northwest of Oahu, that that island was in the direct path of the storm and the damage was there was likewise extensive. He added that communication with Kauai was difficult but that one amateur repeater was being used for that purpose.

WD4FAB noted that HF conditions were poor at the time, making the handling of traffic with Hawaii difficult at best, but that AO-13 was able to provide a usable circuit. He said that he had made a schedule with WH6IC for the following day in order to help with any storm related communications. Further, all AO-13 and OSCAR satellite users should be on the alert for QRP stations from from the Island of Kauai for emergency and health-and-welfare traffic.

[The AMSAT News Service (ANS) would like to thank Dick Jansson (WD4FAB) and Bill Tynan (W3XO) for this bulletin item.]

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 078 (OPDX.078)
September 14, 1992
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, DXNL, DF4RD, AD1C, KC1YR, KE2LJ, WB3LHD, JH1FDP, KD7E & CADXA PackCluster, K8BL, NW8F, ON1AIG & ESDX and VE3CDX for the following DX information.

7O, YEMEN. There was a station, 7O0ZZ or 7O1ZZ, reported to be working the Europeans, and the operator was to be VE7ZZ. Stuart, WA2MOE, requested Victor, VE7JX, to telephone Stewart, VE7ZZ, and found out that 7O0ZZ is a slim. VE7ZZ is not in Yemen, has never been in Yemem and does not want to go to Yemem.
However, WA2MOE, mentions there is a good prospect of a 4W operation. The callsign 4W8AA might be used in San'a, the captial of the former country called the Yemen Republic which merged with South Yemen two years ago to form Yemen.

7P, LESOTHO. 7P8FE has been quite active this past weekend on 10106 kHz around 2200z. QSL via OH3GZ. Meanwhile, a special request from 7P8SR states he can not use IRC's in Lesotho. He claims they are no good in his country and he will no longer answer cards that come with IRC's. QSL 7P8SR to: Raymond Shankweiler, P.O. Box 333, Maseru 100, Lesotho.

9M6, EAST MALAYSIA. Yutaka, JA9AG, will be active from October 8-12. His callsign will be 9M6AG or 9M6/JA9AG. Activity is unknown, but 6 meters was mentioned.

9X, RWANDA. Hartmut, 9X5HG, and 9X5AB (Beglium Embassy) were active this week. 9X5HG was heard on 7003 kHz around 0130z and 21037 kHz around 1715z. 9X5AB was heard on 14021 kHz around 2130z and 7003 kHz around 2300z. QSL 9X5HG to: Hartmut Gumpert, P.O. Box 420, Kilgali, Rwanda. QSL 9X5AB to DF3ZJ.

AP, PAKISTAN. This will probably be your last week to work John Gagen, AP/WA2WYR, because he will begin packing up his equipment next weekend. He leaves Pakistan October 1st. John's QSL Manager has a new address. QSL to: Ken Swanson, KK6TX, 941 Jennifer St., Incline Village, NV 89451.

C6A500, BAHAMAS. The Bahamas Amateur Radio Society (BARS) will operate the station C6A500 throughout the month of October to commemorate the 500th anniversary of the discovery of the New World by Christopher Columbus.

All authorised BARS members may operate with the /500 suffix throughout October. There will be a continuous operation by C6A500 on October 12 from 0001 to 2359z, while the rest of the month C6A500 will operate on an intermittent basis. Two types of awards will be available: 1) Three different /500 contacts; 2) Ten different /500 contacts, one of which must be C6A500. For QSL send SAE & three IRCs to BARS, Box SS.6004, Nassau, or Bahamas Bureau. For award, send copy of log & three IRCs.

FW, WALLIS ISLANDS. Martin, G4DZC, plans to be active October 20-27. He will be operating SSB and CW on various HF bands. He expects to be using the callsign of FW/G4DZC. He will also be active from Fiji, October 29-30. He applied for the callsign 3D2ZC. QSL both operations to: Box 620674, Newton, MA 02162.

J5, GUINEA-BISSAU. Mark's (J5UAI) QSL manager has a new address. QSL to NW8F, Cecil Williams, 975 Kittle Rd., Wheelersburg, Ohio 45694.

JT, MONGOLIA. The European Satellite DX bulletin states Ron, K7HDK, will be active from Ulan Batar September 17-29. This will be a satellite DXpedition only. QSL via KL7GRF.

KH0, SAIPAN ISLAND. JR6IQI and JK6UER will be active from September 18 to 22. Callsigns will be KH0/JR6IQI AND KH0/JK6UER. They will be on 160-6 meters and on SSB/CW. QSL to each station's home call, or JARL or JR6IQI 1992 CBA.

S5, SLOVENIA. Sharon, KC1YR, was told by a Slovenian ham that their country was issued the new prefix S5, which will be used starting October 21st. (This is UNOFFICIAL.)

VK9, COCOS KEELING ISLANDS. According to the Southern Cross DX Net, begin looking for VK9CY on September 16th for 14 days. QSL via VK6XW from the 1992 callbook address only.

VP8SSI CARDS UPDATE. It was reported that 10,000 QSL cards have arrived stateside and made it thru customs. They have been delivered to AA6BB and they should be coming out shortly. This is just the first batch, so if you do not received a card, PLEASE BE PATIENT.

VU7, LACCADIVE ISLANDS. According to ESDX, sometime in October (7-9, 18-20 or 30-Nov 1) there will be a three day operation by Vidi, VU2DVP. Activity will be mainly on the satellites. QSL via KL7GRF.

YX0AI CARDS UPDATE. Mother nature has now played a role in the holding up of these cards. W1RM who has been trying to collect log information from some indivduals with hopes to retrieve their YX0AI cards states: The cards that were passing through customs were slowed down because of Hurricane Andrew. Apparently, the paperwork was organized in Miami and all documentation was destroyed. The cards are expected to be cleared and in Venezuelan hands by next week, September 14-18.

ZL8, KERMADEC ISLAND. Bob, ZL4DO, stated a ship will be leaving for Kermadec on September 14. He has a very busy work load on this trip.

If he gets a chance to operate, it will be most likely sometime on the 16 or 17 of September. The callsign will be ZL8RS.

DXCC BACK LOG. It was reported that the DXCC Desk is processing April submissions, but mailing out March submissions.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. Bill.... I think that is a great idea! What is above and below the 2 meter ham band but government services, right? The MARS bands? I know here in MA there are Army, CAP and Air Force MARS repeaters directly adjacent to the 2 meter band... maybe some of the CAP and MARS types can enlighten us.... you all (I am not going to say guys!!!) have had probably been somewhat involved with setting up comms in these bands.... what are the chances? Is it practical to think we could ask for a frequency in these bands?

I really do not want to even think about reserving a amateur radio frequency EXCLUSIVELY for emergency calls! But it would be nice to have a "national" emergency calling frequency where we know there will be monitoring on a regular basis.

Bruce.... here is some of the programs that I knew that were out there. I thought that there was some of these on the UCSD machines. Maybe somebody elese will chime up with what is actually on the internet via ftp. I have lots of stuff online via dial up... but do not have ftp access for you. Sorry

==========

MacNet
Public-domain programs (currently on nine disks) contributed by Macintosh packet users. Includes test preparation, contest logging, propagation prediction, satellite tracking, and amateur television. Send formatted 800K Macintosh disks with stamped, self-addressed disk mailer to John D. Seney, KB1HE, 144 Pepperidge Dr., Manchester, NH 03103. Contributions of public-domain programs are encouraged.

"Amateur Radio Software for Macintosh"
Extensive catalog including logging, Morse code, gray line, test preparation, satellite tracking, contesting, and packet radio programs. ZCo Corporation, P.O. Box 3720, Nashua, NH 03061.

LOGic
(Macintosh version scheduled.) Lets you define the rules determining dupes (such as once per band or once per contest). Displays heading, distance, and other information about the country being worked. Automatically enters contact time; if interfaced directly to a radio, also enters the frequency, band, and mode. Shows status toward earning amateur-radio awards. User-definable database fields. Exchanges data with other programs. Personal Database Applications, 2634 Meadow Bend Court, Duluth, GA 30136.

FDLog!
Contact logging and duping program. Can transmit any of ten programmable CW messages. Generates real-time statistics on QSO rates. System One Control, 3900 85th Ave N, Suite 200, Brooklyn Park, MN 55443.

Ham Radio Station Logbook
HyperCard stack that stores and displays radio contact information. Automatically stamps entries with time and date. Contacts can be sorted by frequency, call sign, or date of contact. Includes report formats, a "Q-code" reference list, and on-line help. SanSoft, 892 E. Quail Place, Highlands Ranch, CO 80126. (The same program appears to be available from Heizer Software, 1941 Oak Park Blvd., Suite 30, Pleasant Hill, CA 94523.)

HELP!!!

More specifically, the stingy administration here slashed our budget ($0.00, nil) and we're pretty much stuck with a fucked-up soundboard that's about 30 years old. It's a worthless piece of shit. A regular dinosaur of technology, and despite the fact that $375,000 was spent on renovations to the President's home, they refuse to provide funds for a new one.

So, like, if any of you out there know where we can get a cheap-but-good soundboard, new or used, PLEASE let us know. We need one desper ately if this campus is ever going to have an alternative to Top 40, Garth Brooks, & Kriss Kross.

Help keep alternative/industrial alive on the airwaves...Lend a hand to a poor college radio station. =)

2613. SAREX Update

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-13 23:47:54 UTC
From: abfhb@stdvax.DNET.NASA.GOV
Message-ID: <9209132325.AA27951@east.gsfc.nasa.gov>
Source record: 285392

SB SAREX@AMSAT $STS-47-001
STS-47 SAREX Update

This is a SAREX update for STS-47 on September 13, 1992 at 18:00 UTC.

With approximately 24 hours of on-orbit operations, the Shuttle Amateur Radio Experiment (SAREX) is performing flawlessly, providing excitement and an educational experience to school groups and radio amateurs worldwide. Just a few hours after launch, Mission Specialist, Jay Apt, N5QWL, checked out the SAREX station, which includes 2-meter voice and packet. After the station was checked out, the Heathkit HK-21 TNC was configured for packet robot operations while the crew continued their activation, checkout, and initial operations of the Spacelab-J hardware. In the scant few hours since the station was activated, over 632 packet contacts have been made. In addition, three school groups, two in Australia and one in the U.S., have made superb horizon to horizon contacts with the crew. These include the Australian Maritime College, which asked 7 questions, the Wesley College, in South Perth, where 9 questions were asked, and the Del-Mar Middle School in Santa Cruz, California. At Del-Mar middle School, 7 students asked 7 questions with over 150 students in attendance. Two more Australian and three more U.S. school groups have yet to have their turn on the mike.

As a reminder, the SAREX station on-board the Space Shuttle Endeavour has two radio amateurs on board. This includes Dr. Jay Apt, N5QWL, and Dr. Mamoru Mohri, 7L2NJY. The packet radio callsign is W5RRR-1. The 2-meter FM voice and packet downlinks are on 145.55 MHz.

Uplinks are: Voice Packet

Several weeks ago someone posted a message here about starting a project to create the ultimate manual on the Kenwood 741...

I sent the poster a reply indicating that I was interested and willing to help out, but never got a reply; nor have I seen anything further here on the newsgroup about it.

If you are the person who posted the original message, or you replied to the original poster and got a reply (or still have his address); please let me know. I am still interested in this project....

Thanks much,

2619. Re: DJ-580T problem with audio drop out using T-SQL

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-14 05:17:19 UTC
From: gkd@wpi.WPI.EDU
Message-ID: <19178vINNl0i@bigboote.WPI.EDU>
Source record: 285399

The tone squelch decoder on the DJ-580 has several peculiarities which I've noticed:

1) When receiving in the tone squelch mode, the tone squelch decoder remains "open" for two seconds after the incoming tone-equipped signal ceases. This in essence means that the radio is in carrier squelch mode for two seconds until the tone squelch decoder "resets." This could actually be construed as a feature, since it allows the user to automatically monitor the frequency between transmissions for any non-tone equipped signals.

2) When in the tone squelch mode and receiving a non tone-equipped signal, the speaker will remain silent. However, if a stronger tone-equipped signal appears on the frequency while the non tone-equipped signal is still present, the decoder waits two seconds before opening up on the tone signal. This means that you miss the first two seconds of the tone transmission. Note that the same thing happens if you leave the squelch "open" while in the tone squelch mode. The radio sees the open squelch as a non-tone signal.

3) As the manual points out, the tone squelch function only works on the main band. The sub-band goes into carrier squelch mode, even if it had been programmed as tone squelch.

4) When switching the main band from VHF to UHF or vise versa by pressing one of the band buttons, the radio does not read the PL tone frequency programmed into the new main band until the user performs some additional function on the new main band. This function can include transmitting, changing the frequency or memory channel by rotating the tuning knob, pressing the up/down buttons, or setting the radio to scan; switching from memory to VFO or to call channel (or vise versa), or pressing <FUNC>TONE followed by the main band button again.

EXAMPLE: Enter a frequency of 446.000 in the UHF VFO with the Tone Squelch activated. Set the tone to a frequency of 88.5 Hz. Now press the VHF button and enter a frequency of 146.52 in the VHF VFO with the Tone Squelch activated. Set the tone frequency to 100.0 Hz. At this point, the radio is recieving on 146.52 MHz in the Tone Squelch mode with a tone frequency of 100 Hz, and in the carrier squelch mode on 446.000 (since UHF is currently the sub-band). Now press the UHF button to make UHF the main band. This causes 146.52 to revert to the carrier squelch mode, and 446.000 becomes tone squelch. However, the tone frequency on 446.000 is 100.0 Hz (which had been pro-grammed into the VHF VFO) rather than 88.5 Hz (which had been

programmed into the UHF VFO). To get the radio to switch to the UHF tone frequency of 88.5 Hz, you must perform one of the functions mentioned above. (This problem would still be experienced even if the Tone Squelch mode was not used on 146.52 MHz as long as the frequency which the 2 meter tone were set to was not 88.5 Hz.)

Note that if the battery save feature is active on the main band and the frequency remains quiet long enough for the feature to kick in, the radio will also revert to the correct tone frequency.

5) If using the radio in crossband repeat mode, the same tone frequency should be programmed into both bands when the tone squelch function is used. If the tone squelch function were used and different tone frequencies were set for each band, activity MUST alternate back and forth between the bands. The radio will not hear the second of two consecutive transmissions on the same band. (This condition is related to (4) above. The "main band" appears to kick back and forth when in crossband repeat.)

6) When scanning memory channels programmed in the tone squelch mode, the radio will stop scanning on any non tone-equipped signal, but it will remain silent.

Getting back to the problems mentioned in the newsgroup, the two second dropout experienced when the main band was switched while a tone-equipped signal was being received appears to be related to (2) above. The radio may see this condition as a tone-equipped singal being received while a non tone-equipped signal was already present. If the tone-equipped signal disappeared when the main band was switched and did not reappear after two seconds, the problem would likely be related to (4) above.

In the case of the radio muting a tone-equipped signal during mid-transmission when in the tone squelch mode, I suspect that the tone on the signal was either too weak for the decoder to sense or it was off frequency. This happened to me a couple of times when I was using the '580 to monitor a group of handhelds operating on 151.895 MHz. One of the handhelds did not reliably activate the tone decoder in the '580, even though the decoder on a base station operating on that frequency had no problem with it. (The other handhelds seemed to hear it OK too.)

These problems are somewhat peculiar, but are not really crippling to the operation of the tone decoder. I find that it does help to understand what is happening though.

Greg

2620. CW Speed Contests?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-14 05:18:31 UTC
From: haynes@cats.ucsc.edu
Message-ID: <1917b7INN3m9@darkstar.UCSC.EDU>

2621. Re: How far does 4 watts (CB) go?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-14 05:30:09 UTC
From: jab0684@usl.edu
Message-ID: <1992Sep14.053009.7414@usl.edu>
Source record: 285400

Well, I a radio shack Hand Held 4 watt CB. It's the kind with the green LED display, and rubber duck antenna. Under good conditions I've managed communication about 6 miles to someone with a home antenna(don't know the type). In general I can get several miles with it.
However, the second I step inside the car with it, it's abilitiy to transmit and receive absolutely DIES. No doubt this is do to the propagational characteristics of frequencies in the approxmately 26.49-27 mhz range occupied by CB radio. That is, signals of this frequency are not successfully able to reflect off of my car's sheet metal and reach it's interior. Likewise, they don't manage to reflect out of the car very well.

So, an exterior antenna on you car can make the difference between having something with the range of your kids 9 volt powered walkie talkies, and a usable radio service.

>battery....

Hi Robert,
Don't forget to COMPRESS and UUENCODE your battery first!

For the rest of you ..
How to stop your battery discharging on concrete:

1: Rip all those nasty ol' PL259 bconnectors from your VHF/UHF equipment. Use them as standoffs between the battery and the concrete.
NOTE: If you already have nice piece of wood to protect your battery from discharge, you could send all your unwanted PL-259's to Craig Shergold instead.

2: Pile up all your Craig Shergold chain letters on the concrete and put the battery on top.

3: Hang the battery from the ceiling with a piece of 9913 cable.

Any other suggestions?

Simon Woodworth.

> There is no need to worry about the ground on the antenna. The
>power socket floats and the antenna ground is negative.
True!

Folks,
Maybe this is a dimwitted idea, but why don't you just rewire
the power cords and sockets so their polarity is reversed? I
agree, though - It doesn't make any sense to put the positive
feed on the sleeve instead of the tip. Why can't manufacturers
agreee on a common standard for these things?
However, for this to cause a problem with a negative-earth car
your portable/mobile would have to have a positive-grounded
chassis, which would be VERY unusual. Anyone with a positive-
grounded car (also very unusual and not made anymore anywhere!)
could have real problems, though.
Apologies if I have attributed the included messages to the
wrong people - it wan't too clear who wrote what from the prev-
ious message on this subject.
Best wishes,
Simon Woodworth.

2628. how do I qsl a ship ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-14 13:50:11 UTC
From: noah@acsu.buffalo.edu
Message-ID: <BuKMFo.9v9@acsu.buffalo.edu>
Source record: 285408

Last night I was able to log my first utility call. I heard a Ship named the Orleans Star talking to a shore station on 8.785Mhz in upper side band. The shore station was trying to call a phone number for the ship but the line was busy. I've npoticed that Monitoring Times publish a log of calls like this that the readers send in. I also noticed that sometimes people get QSL cards for logging calls like this. I have a few cards from Hams I've heard and from stations like WRNO, BBC and so on. My question is how do I find out the home port of the ship and if I write to them will the send me a card ?
Also does anyone know the address of the Halifax cost guard station ? I heard them on the same freq. giving a weather report. From what they said this freq. is known as ch 14. Does someone out there have a list of all the HF ch's that the ships use ?
F.Y.I. I'm in Buffalo, NY and I was using my DX-440 w/a random wire antenna.

2629. Re: CW Speed Contests?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-14 14:08:02 UTC
From: alan@bambam.es.com
Message-ID: <1992Sep14.140802.17099@dsd.es.com>
Source record: 285410

CW contests are still alive and well. We had both a CW receiving contest and a "QLF" (sending CW with your left foot) contest at the Rocky Mountain Division ARRL convention/WIMU (Wyoming, Idaho, Montana, Utah) hamfest a few weeks ago. I participated in both contests and won neither. The winner of the CW receiving contest was W7KF from Wyoming, who was declared the winner at just under 30 WPM. At 30 WPM you must copy 150 consecutive characters for one minute of solid copy; W7KF had 147 or 148 consecutive characters, as I understand it. There were about 10 participants, and we all made it to the 30 WPM level. We were all using pencil or pen and paper. Many of us can copy CW faster than 30 WPM, so the problem really becomes how to get it down on paper accurately and legibly. It is not easy. W7KF won a new Bencher Paddle - of course.

The QLF contest was interesting. K7RJ of Utah won, just edging out a young guy (I do not remember his name or call) who sent some of the best 10 WPM CW that I have ever heard with his left foot! I thought that he should have won instead of K7RJ, but I was not one of the judges. The judging criteria was accuracy and speed - how many characters could you send in 1.5 minutes. There were also about 10 entrants in the QLF contest. You had your choice of a straight key or a keyer with a paddle made out of a rubber spatula! I do not know what the prize was.

Actually, very few radios operating with antennas INSIDE the car will work.
If you enclose a receiving antenna within a closed metal object (any shape),
NOTHING will get in. Gauss' Law pertains to electromagnetic fields. The
car is a Faraday shield, and the windows aren't usually very good "holes"
in the shield.

With outside antennas, the car can usually act as a good ground plane.

2631. RFP for battery study

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-14 14:17:47 UTC
From: isoper@matrix.cs.wright.edu
Message-ID: <1992Sep14.101747.1@matrix.cs.wright.edu>
Source record: 285425

I THOUGHT A TRANSCRIPT OF THE FOLLOWING DOCUMENT WOULD BE IMPORTANCE
TO THE BATTERY ON CONCRETE TOPIC:

U.S. DEPARTMENT OF BATTERY MANAGEMENT
14th Street S.W.
Washington, D.C. 20001

Subject: Batteries on Concrete
Ref: Placing upon

10 September 1992

In response to the recent "Battery on Concrete" controversy within the
amatuer radio community, the U.S. Dept. of Battery Managment submitted
to the automotive industry a proposal for a five year study by contract
with regard to this subject matter.

However, one of this agencies secretaries (Cheryl who works down the hall
from my office) submitted a document based upon her husbands many years
of work at a local Northern Virginia car dealership. The document states
in part "Why it common sense you do'nt put the battery on the concrete
because if it leaks, the acid ruins the concrete".

Based upon this concrete but simplistic theory, our agency is now issuing a
request for proposal (RFP) as to a feasibility study to test this theory.
Closing date for this RFP will 30 Sept 1992 with requests for cost overuns
(RFCO) due by 1 October 1992.

RFPs must be submitted with DoBM RFP form 110/A-89 and DoBM RFCO form 12/WE-93
in quadricate to Betty (who works at the end of the hall) in person.

Signed

Volta Pyle
Chief Scientist
Battery Research Loboratory/DoBM

>Yaesu FT-736R as your best choices. The Yaesu is cheaper and all
>in one box while the Twins are more flexible. I used to have an
>older pair of Twins (451, 211) before lightning visited.

I've wondered about this myself. It seems to me that the cost
effect solution to having great sensitivity is a mast mounted
preamplifier. Expensive low loss feedlines or mounting the rig
at the antenna usually is less practical. Usually, one preamp
is enough to establish a good system noise figure, unless you
have a really deaf receiver or lots of cable loss. So, if you
take this approach, the sensitivity isn't that important. A common
rule of thumb is to have 10 dB more preamp gain than noise figure for
the VHF bands and 20 dB on the microwave bands (unless you have
interference from strong stations).

Now, what is the dynamic range of the linear transponders of a
satellite? 30 dB? Certainly not telephone quality. How much
better does the dynamic range of your receiver have to be? My guess
is that going from 50 dB to 80 dB would not improve the intelligibility
of signals off the satellite very much (system dynamic range). More
dynamic range is useful in dealing with non-satellite
interference, but I think its safe to assume that signals in a
satellite pileup are coming through the transponder.

I do have to admit that I usually use short feedlines and operate
outdoors, so I could use a hot receiver. Microwave activity is
picking up--I made 22 contacts on 2.3 GHz and higher this past
weekend (wonder how far it is from Rochester NY to Mt Equinox VT).

2634. Problem with ICOM IC-901

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-14 15:06:27 UTC
From: Chuck Adams <chuck_adams@qmail.ssc.gov>
Message-ID: <1992Sep14.150627.24012@sunova.ssc.gov>
Source record: 285411

Has anyone seen this problem with the IC-901 radio? When turning the unit on (with control head and 2M/440 dual band module only, no external band units connected), the unit works properly. When turning the unit off, the control head lights and display go off, but the main and sub bands still receive and if there is activity on either band, it is heard in the speaker. When turning the power back on, the main and sub band audios quit, and all the segments of the LCD display light up and then start to flash. The only way I have found to reset this condition is to remove the power connector from the radio then plug the power connector back in. The radio works again for another cycle as described above.

It has been suggested that I may have a problem with the cable from the control head to the dual boand module. I will check out that possibility. Does anyone know a method or any magic key-strokes to reset the microprocessor if the cable is determined not to be at fault?

> Is it lawful to use ham equipment in other services?
That depends.... It can be used for limited services: RACES, MARS, CAP,
(others???).

> For instance one ham tells me that even if you observed the power rule of
> 4 watts for am, it would be illegal to trans mit in CB channels with
> a ham HF rig. That only a type accepted cb transmitter is accepatable.
> Is this indeed the case?

Yes, that IS the case. Only TYPE accepted (for CB service) equipment can
be used on the CB band. In fact, it is even illegal for an Amateur to open
the cover of a CB rig and make any adjustments (unless the ham happens to also
have the proper commercial license to do this).

>
> Assuming a 2 meter rig can transmit in the Marine radio bands is it legal
> to use to for communicating with other boats? Or is another special liscense
> required(I thought I read it was). Even if a liscense is required
> do I have to use a type accepted marine radio like I do for CB?
>

Nope... Yet again, you must ONLY use equipment that is type accepted for
marine use. It is NOT a license issue.

> Lastly please post the frequency for marine channel 16(emergency channel),
> since surely it would be licit to transmit here in an emergency situation

Hello All!

Forgive me if this post seems out of place, but I am posting this message to many different newsgroups in hopes of a positive response.

I am looking fo a rare U2 single, a DJ/collectors white vinyl 12" single of Zoo Station. The single contains 3 songs:

Zoo Station
Lady with the Spinning Head
Zoo Station (UV1 remix)

If you have this single, know someone who has it, or have seen the single anywhere (I think it was released only in the U.K.), PLEASE respond to me personally via e-mail (as I probably do not regularly read this newsgroup) at the following address:

jalapeno@leland.stanford.edu

ANY information on the whereabouts of this single, no matter how insignificant it may seem, will be GREATLY appreciated.

Taanx in advance,
Jalapeno

Message-ID: <14570489@hpnmdla.sr.hp.com>
Source record: 285341

In rec.radio.amateur.misc, afpauls@lims01.lerc.nasa.gov (PAUL SCHWARTZ) writes:

I have an application where the keying of hand held radio (160 MHZ) is causing an unacceptable disturbance in the signal coming from a position transducer. The position transducer has a signal conditioner mounted remotely from the sensor head. The interferance is picked up at the signal conditioner. If feel that the best way to solve this problem would be to mount the signal conditioner in an RFI proof enclosure. Here are my questions.

Would an RFI proof enclosure work?

First, you should determine where the interferring signal is entering into your system. As you describe it, the posssiblities are:
1) The signal is coupling into the transducer
2) The signal is coupling into the line between the tranducer and the signal conditioner
3) The signal is coupling into the signal conditioner
You mention that the signal is coupling into the signal conditioner. You should be sure of this assumption (an easy way to check would be to disconnect the transducer, terminate the input of the signal condtioner, and see of the interference remains).

If the signal is only coupling into the signal conditioner, then the following things might help:
1) Using good layout practices in the signal conditioner. E.g.,
* solid ground planes
* low impedance power paths (possibly even power planes)
* rf decoupling caps (.01uF) with short leads from the power supplies to ground at various places throughout the circuit
* careful placement of key components, e.g., the front-end amplifier
2) Shielding the signal condtioner. A good shield around the entire signal condtioner may help. Since the dimensions of the thing are large as you describe them, you might even consider using wire mesh (chicken wire??). At 160MHz, a wavelength is ~1.9 meters. As long as you keep the "holes" in your shield well below a tenth of a wavelength (.19m = 7.5 in), the shield will work well. You must take care about how the shield is grounded and about putting gaps in the shield, however.

It may be possible to just shield a portion of the signal conditioner. For example, maybe just the front-end amplifier --- especially if the amp has a fairly high gain.

3) Limit the bandwidth of your system. It may be possible to
put enough filering in the signal path to "bleed off" the
rf interference signal. Presumably, the tranducer output is
at audio frequencies or below. You should be able to place
low pass filtering in the signal path, e.g., small shunt caps.
Make sure that the capacitors have short lead length and that
they are tied to a good ground plane. Otherwise, you run the
risk that the caps will resonate as rf frequencies and prove
useless as low pass filtering.

If the interferring signal is entering into other parts of the circuit,
these things may help:
1) Shield the line between the transducer and the signal conditioner.
I would suggest a twisted-wire pair with a shield (assuming the
transducer outputs a signal differential signal).
2) Shield the tranducer.

Chris

2643. DXCC Application Rules ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-14 17:02:02 UTC
From: dearnshaw@worldbank.org
Message-ID: <1992Sep14.170202.408@worldbank.org>
Source record: 285423

As I recall, the rules concerning submitting cards for DXCC were something along the following lines:

1. Submit initial application (100+ cards)
2. Subsequent submissions for the same DXCC follow the rules:
a) Between 100-200, submit enough cards to bring total up to nearest 25 boundry (ie, 125,150,175, etc)
b) Between 200-300, submit enough cards to bring total up to nearest 10 boundry (ie, 210,220,230,etc)
c) Between 300-310, submit enough cards to bring total up to nearest 5 boundry (ie, 300,305)

(I know the actual boundries may not be totally accurate, but it suffices for the example.)

My question is: Do these rules under item (2) still remain in force after computerization?

Or, can I now submit a batch of cards, where some will be credited to one award, and some to another, even though they don't bring totals up to the magic boundries? One would assume that with computerization of one's DXCC records, submission in groups of 25,10, or whatever would be irrelevant - the computer will keep track of the various totals.

If anyone (in particular, the League) could clarify this, I'd appreciate it.

Thanks... Darrell (NR3Y)

2645. F***ed up DJ's

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-14 17:45:42 UTC
From: pschleck@cwis.unomaha.edu
Message-ID: <pschleck.716492742@cwis>
Source record: 285329
Cross-posted to: rec.radio.amateur.misc,rec.radio.noncomm

To the foul-mouthed DJ's from a North Carolina college radio station:

Us techie types are always sympathetic to college stations in need, but let me make some suggestions to help endear you to the Usenet community:

- Hams (rec.radio.amateur.misc) are generally a conservative lot, and don't take kindly to messages carpeted with obscenities.

- Usenetter's in general are turned off by multiply-posted (rather than cross-posted) messages with "HELP PLEASE" in the Subject (as if there aren't 2000 frivolous posts in the news spool with the same Subject).

So, if you really want some assistance, how about rephrasing your request in a form presentable to polite company?

Paul W. Schleck, KD3FU

To Michael and all others needing MARS mods.

The person I have normally received the best response from at ICOM with regards to mods, is David Weigel at 206-454-7619. THEY DO REQUIRE A COPY OF YOUR MARS OR CAP LICENSE.

Kenwood requires the same procedure and they are very difficult to deal with on mods. I even sent a letter Fedex to Japan one time and never received a response!! I am not Kenwood bashing but I give their service a Grade of "F" on both their Amateur and commerical side.

I still wish Ten-Tec would make a good vhf/uhf/shf radio for terrestrial and satellite use. (With "N" connectors of course!!)

> fine.

Good try, bad example. Few repeaters seem to stay within the 4.5kHz
deviation needed to minimize interference on a 15khz band plan, to say
nothing of the ludicrous settings of most amateur FM radios from the
factory. (must be another 80m thing like PL-259's) :-)

2652. Re: Satellite rig: Kenwood TS-790a or Yaesu FT-736r?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-14 19:39:11 UTC
From: n4hy@idacrd.UUCP
Message-ID: <1628@idacrd.UUCP>
Source record: 285334

I am in complete and total agreement with the comments made by
Gary Coffman. I own a Kenwood TS790A, Yaesu FT-736R, and Icom
twins. I prefer the Icom twins because they can be used seperately
but they are expensive when you consider they cover two bands and
the 736R is a nice package covering many bands with the appropriate
modules added. The 790 is one of the most poorly thought out radios
For a particular mode of operation I have yet seen in amateur radio.
Most of the functions required so many key strokes to get to that
I have to resort to the manual every time I want to change stuff around.
The ease of operation of the 736R, the quality of the workmanship, and
the fact that when problems were found in the early models, Yaesu fixed
them, lead to me to only once choice. If I could not afford seperates
for all the VHF/UHF/ Microwave bands, I would definitely choose the
736 over the Kenwood. I only use the Kenwood as a two meter IF when
on Mode S or mountain topping now.

Well, for goodness sakes. I had rather thought we were onto something here.
I suspect the problem with the serial port was that it was one of those 9-pin
jobs instead of the full-size 25-pin connector. You CAN get an adaptor. But
more importantly, it depends on how you walk up to the connector to start with.

>I don't see how such a thing could be done. The Icom 725 seems
>to be a no-frills rig, and the prices recently for a new one
>came down to about $750.

The crop of all-mode 10m radios are essentially no-frills radios with
only one band. If you add in $125 for the cost of band switching relays
and low pass filters (inductors and capacitors), then you end up still
below $400.

>I don't think an all-band HF rig with
>2 VFOs has EVER sold for as low as $400, not even in the good-ol days.

Keep in mind most of the multi-VFO radios sold today have only one PLL
synthesized VFO and emulate multiple VFOs by reprogramming the PLL
synthesizer. There is little difference between an additional VFO and
a memory channel.

>I saw an ad for a Drake TR-4 from the early 70's that sold for $600
>new.

Yup, and my TS-520S sold for $600 new, too. In the low volume amateur
market, I think the prices tend towards the highest the market will bear.
In high volume markets, like CB, the prices are seriously eroded.

>Further, the 725, 726, and 735 are NOT the best choices for RTTY or AMTOR. In
>fact, the IC-751A is a fairly good choice for these modes, but is a dated rig.

I did not see a price class in the original posting. The original
posting said "I mainly work CW." For price vs. performance, the 735
is a great CW rig. I have used it with an MFJ 1278 for RTTY and AMTOR
with no problem. You are correct, the other rigs you mention are better
for RTTY, but it did not sound to me like those modes were very important
to him. Also, he mentioned that he liked SSB contests, and I like
the 735 and 726 for that as well. The 726 is particularly easy
to use when working splits and changing bands. My experience
with the higher-priced rigs led me to the conclusion that they
were not worth the higher prices. Of course, I am not
a hard-core contester, but the original poster didn't say that
he was one either.

So, I was simply offering my advice and very positive experience
with the lower-end Icom rigs. I don't believe I should be scolded
for talking time to offer advice.

I also cannot recommend any Kenwood rig for any reason right now.
Their serivce is horrible. They do not deserve our business.
Icom's service out of their Bellevue WA facility is outstanding.
(I was talking to their tech support earlier today)

2663. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-14 22:10:24 UTC
From: tkelso@afit.af.mil
Message-ID: <1992Sep14.221024.2580@afit.af.mil>
Source record: 285343

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

>5,312 to maintain continuity in my accounting. Any competent check
>forger knows this too, so being concerned about low check numbers
>only catches the amateurs.

About 75% of the bad checks that my retail store took in 5 years had a low check number. This is one of many factors I listed that should cause suspicion.

I also said "be suspicious", not "absolutely do not take the check." I ended my posting with the advice of "use your common sense and judgement."

There is something that everyone needs to understand about personal checks. They are, in fact, I.O.Us. That's right: it's the same thing as someone writing "IOU" on a blank sheet of paper. Personal checks are, when all is said and done, a promise from the individual that they are good for the amount on the check. If the check bounces, you have only one choice, and that is to get the money from the person who wrote the check. If the person refuses, or if you cannot contact him, then you are out of luck. PERIOD. Sure, you can call the police and try to take someone to court, but this takes time and energy and rarely produces results. The banks do not care and offer no protection from fraudulent check writers. As a person who is accepting a personal check, you are on your own.

I also said in my article that most hams are honest, and that since ham equipment usually does not have a high black market value, you are a bit safer. However, you have got to protect yourself from getting ripped off. Things just get worse during a recession. When I heard about the guy taking check number 115 with an expired driver's license, I could only shake my head. I only hope that others do not make the same mistake.

Once again: if you are suspicious of the check, offer a deal
where the guy pays at least some cash along with the check.
The crooks will always refuse that deal. No one will pay you
to rip you off.

>>this subject. As usual, they have missed the main point: The original
>>post was EMPIRICAL EVIDENCE... that is, DATA.

>Funny, what I read was not EMPIRICAL EVIDENCE at all, simply OPINION.

Fair enough. In five years of working in retail, and based on the
experience of other retail sales managers, here is some
empirical evidence. The numbers are approximations, but are based
on actual research that I did on the subject for my company:

Total number of checks: 10,000
Number returned from bank: 300 (3%)

Of the 300 returned ....

REASON:

Not sufficient funds 70%
Account closed 15%
Stopped payment 15%

Checks eventually paid by customer: 100 (33% of bad checks)

Avg. time required from retail employee to attempt
to recover funds from returned checks: 2 hours per check.
(repeated phone calls, interviews with police, court
appearances, etc.) May I say that this was very stressful
and unpleasant work.

Of the 200 where the funds were never recovered:

Total retail value: $30,000

No valid driver's license: 60%

No pre-printed name/address: 30%

Low check number (below 500): 75%

Altered driver's license: 10% (usually from a stolen wallet)
(pasted new photo, etc.)

Altered check: 5% (usually a non-pre-printed
check with an address that
was added by the scammer)

Purchased item alone (no 25% (meaning most are in groups)
one was with him/her)

Seemed to be in a hurry 75%
or irritated

No major credit card 75%
(VISA, MC, Amex)

Bought on weekend or night 90% (when banks are closed and we cannot
call them)

Bounced even though bank said 5% (banks offer no protection)
that there were sufficient
funds in the account when
we called

Customer accepted a 1/2-cash 0%
1/2 check deal

This does not add up to 100 because most checks had
multiple suspicion elements. ALL of the 200 bad checks
had at least one of the above problems, and in almost
all cases, at least two.

This is not a case of "discrimination." This is simply
a case of a merchant protecting himself/herself.

>>
> I'll take one as long as its all-mode and reasonably sized (for
> mobile use).

It would be great if more all-mode 6M rigs were available at more
reasonable prices. Yaesu did come out with an all-mode 12m, 10m,
and 6m rig (100W), but its price is high. ($1800 if I recall correctly)
The Yaesu FT-690-II is the smallest all-mode- small enough for
mobile or portable- but it costs about $650 and only covers one
band.

My dream rig would be a small, 12V dual-band (6m/2m) all-mode 10W rig
with a detachable linear amp for 100W. Make that baby $650 and I'll
buy one, and so would a lot of others. (Well, one can dream, I suppose)

An FM-only 6m/2m dual-bander is a nice idea, but I doubt that it
would sell. 6m FM is not popular for a reason: the range is
lower and the noise is higher than on 2m.

> Is this indeed the case?

With few exceptions (Amateur and the 1750m experimenter services come to mind), ALL transmitters MUST be type accepted for use in that service. Therefore, you can NOT use your Ham rig on CB.

> Assuming a 2 meter rig can transmit in the Marine radio bands is it legal
> to use to for communicating with other boats? Or is another special liscense
> required(I thought I read it was). Even if a liscense is required
> do I have to use a type accepted marine radio like I do for CB?

Marine band also requires type accepted radios, and a license for them as well. You can't legally use your 2m rig in the marine band under normal circumstances.

> Lastly please post the frequency for marine channel 16(emergency channel),
> since surely it would be licit to transmit here in an emergency situation
> with a 2 meter ham rig.

Ah, the term "emergency"... If you were out sailing and someone got hurt, you could then turn to 156.800 (marine channel 16) and call for help on your HT (assuming that you don't have a "real" marine radio, of course). 97.403 and 97.405 allow you to use whatever you have to get help in an emergency. FYI, 27.065 is CB channel 9, and 27.185 is CB channel 19.

The same problem seems to exist on the standard C528, if anyone has a solution to this one I'd be grateful for it! It makes the tone squelch useless on receive, which defeats the object of having it.

Conversely, the tone squelch on my FT23R and FT211RH work perfectly.

Don't be silly! We don't have positive earth cars over here! Just because we drive on the correct side of the road :) I think the last car I recall with positive earth was a VW beetle made in 1964... Also, I think you'll find even though the outside is positive, it doesn't necessarily follow the chassis of the set is positive.

I do take your point and agree it's a problem; the lead only has to flap against the deck to pop the fuse out, but it's ok when in the radio.

There are, actually, 2 radios on the market that technically fit your
description; the Icom IC-901 and the Kenwood 741/641. They are radios
that start as 2m/440 (2m/220 for the 641), and you add a 6m module. The
only disadvantage is that to do so, you're laying out $1000-$1200...

That is unrealistic on CB with hand-helds. You are lucky to get one
mile under practical conditions. (buildings, hills, others
on channel, etc.) If you have line-of-sight, you maybe can get 5 miles
reliably. Remember, they are using short HT rubber duck or telescoping
antennas.

>CW contests are still alive and well. We had both a CW receiving
Yeah, I know about the contests at hamfests; what I want to know about are the contests which McElroy participated in, which I gather were a much bigger deal. There is a typical-of-the-period picture of him surrounded by trophies he had won. I assume these were contests for commercial operators.

This got me to thinking about contests of skill for people in other occupations. It's been several years since I have read about a typing speed contest - the last one I heard about was won with a speed of 130 WPM or so. Maybe there were shorthand contests for stenographers at one time. The rodeo continues as a contest of cowboy skills. You just don't hear much anymore about contests where working people compete on their abilities. I'm not counting things like the Oscars and competition that a professional photographers organization holds, nor awards and honors, because in these things people are not competing against each other on specific tasks.

I am pretty conservative. But I am not a prude. I have no problems with the odd swear word - even an obscenity, but I haven't seen any here. You can check alt.sex.bondage for obscenity, even alt.tasteless has its moments. But occasional "effing and blinding". Adds a bit of colour to life if you ask me.

>So, if you really want some assistance, how about rephrasing your
>request in a form presentable to polite company?

Polite? I am pretty polite, I swear alot though. Now talking of polite, should these fellows listen to an HF contest for that wonderful "after you old boy" politeness? I don't think the amateur community is in any position to provide pointers on manners.

These fellows in North Carolina need a mixing board, they are pretty angry that the big cheese gets a big remodel job but they don't have a few bucks for the station. I can understand that. I would be grumpy too.

I wish them every success in their endevours. If I had a mixing board in my telecom warehouse/garage, it would be on its way already.

SB SAREX@AMSAT $STS-47-007
SAREX Packet Frequencies

This is a reminder that the SAREX payload on STS-47 is operating in
a split frequency mode with separate uplink and downlink frequencies.

To connect to the packet robot, transmit on an uplink frequency of
144.70 MHz. The downlink packet frequency is 145.55 MHz. Use this
frequency to receive the TNC packet data from the Shuttle.

Also, the packet robot operates using the callsign W5RRR-1.

This message is from the SAREX working group.

2681. Kenwood 731 duo-bander PL decoder needed

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-15 06:06:27 UTC
From: morris@grian.cps.altadena.ca.us
Message-ID: <1992Sep15.060627.10245@grian.cps.altadena.ca.us>
Source record: 285355

Does anybody have the manual for a Kenwood duobander (2m/440)?
I need the model number for the PL decoder option (need the decoder too -
but that I can purchase once I know what to order...).

Also what is the value for the in-line fuse?

I may not see your post, so please email also.

Thanks in advance.

2685. Yaesu FT-470 scanning in priority mode

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-15 10:47:14 UTC
From: n7949188@henson.cc.wwu.edu
Message-ID: <1992Sep15.104714.4943@henson.cc.wwu.edu>
Source record: 285368

First of all, thanks to the many of you who sent info on mods to the FT-470. I tried to send individual thanks back, but I think I may have lost a few. (I am rather new at this...) I have done a few of the programing mods and am quite a happy camper!

Now as for as this scan goes, the manual says I can scan while the rig is in priority mode. For me, I put it in priority mode (FM+VFO), then press the up (or down arrow) to start the scan. As long as I hold the key down it kind of scans, but not like it should: as soon as I release the arrow, the scan stops at that fx.

I would love to figure this one out. Any ideas?

>
You must be a used car salesman. Your information is, in my opinion as a 25
year ham very misleading to the point of being totally worthless to any new
commer out there. Listen people, there are protocols for handling health
and welfare traffic on ham frequencies for disasters such as this. Generally,
this is coordinated through the local authorities to RACES. Without power
on Kauai, I doubt you will CQ into many hams trying to call a well intentioned
person on the mainland to make a few phone patches. The idea is totally
rediculous. Most activity will likely start off with UHF/VHF packet and
repeater activity (I believe we have seen those postings already on this
forum), then become more more generalized to HF. Remember, those Kauai
hams KNOW THE HAMS ON NEARBY ISLANDS HAVE (AND HERE IS THE BAD WORD) *
TELEPHONES* who can make all the calls to loved ones they want. They
won't likely be sitting on HF looking for those 255 degree beam headings, they
will be concentrating on local communications to the other islands. In fact,
I understand that much telephone service is already restored to Kauai.

Now if you are interested in getting messages to Kauai, I suggest you try the phone first, it might be working. Second, try to find your SCM, that's Section Communications Manager to get the update on message handling from your part of the country to Hawaii. You might even ***LISTEN*** to those frequencies and learn how message handling is done at first, to kill those urges of the 255 degree CQ.

Good luck, Kauai!!!

How often is this satellite in this mode? I got curious when I heard
about it and decided to give a listen. I programmed the frequency into
the scanner and left it on for a few days. Nothing!! Is this mode only
active on rare occaisons?? Or is there actually no one using it??
Am I going to have to dig up some Satellite Locator Software just to try
and hear this thing??

Hello

I'm looking for the high voltage transformer or the HV power
supply of the Tektronix 453 scope. Mine has a short in the
secondary winding.
The Tektronix service told me they can not deliver it anymore.

If you have an old part that you don't need anymore it would be
nice to give me a note via E-mail.

>
>Paul Anderson WB0ZRD at AT&T Bell Labs in Denver.

I also can say that I am very pleased with the TS-850S I purchased last March.
It has turned out to be the greatest HF Rig I have ever owned! If you get a
chance, you should find a fellow ham in your area that has a TS-850, and ask if
you can check his radio out. Most hams just love the chance to show off their
equipment!!

Even better, would be a side to side comparison, maybe at a local Ham radio
store. (although these establishments are difficult at best to find in some
parts of this country.)

I believe that there *is* a service (called something like Tele-Check)
that does guarantee payment if you run the checks through them for
verification (just like when you get a credit card authorization
number, well, similar anyway).

Don't banks in the US provide a cheque guarantee card? If I
write a cheque in Ireland, I have to present a card which guaran-
tees the retailer that the bank will honour cheques up to a face
value of IEP100 (180 dollars approx). If your purchase exceeds
this, the retailer can ask you to write several 100-pound cheques
instead of one large cheque to pay for it.
If I was a retailer, I'd ask for a credit card instead.
Simon Woodworth.

2693. U.K./U.S.A. Technician Recip Licence

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-15 13:20:07 UTC
From: julian@bongo.UUCP
Message-ID: <613@bongo.UUCP>
Source record: 285318

Background: The U.K. does not have a reciprocal agreement that allows U.S. Technician licencees to operate from Britain. The U.S. does, and always has allowed U.K. B licencees (No-Code Technician) to operate in the U.S.A.

I have been whining to the ARRL about this for some years. My last correspondance with the ARRL on this matter was less than satisfactory - letters on file.

So I have been chatting with the "Amateur Licensing Section, Radiocommunications Agency" (U.K. FCC) about the situation. I reported on July 17 this year that they were working on it but told me it could take up to six months or so.

I just called my contact, Miss Fenton, again. She told me: "Talks are in progress, there is no conclusion as yet." She also told me they would send me a letter when it was finalised.

So we can assume that matters are progressing and when they felt they have spent enough time spinning their wheels (poncing about) to appear dilligent and bureaucratic enough, the agreement will fall into place.

Changes: date and time created 92/08/13 18:17:07 by pschleck

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, and rec.radio.swap newsgroups. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 3 June 1992.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those

folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the structure we now use.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.packet is for discussions related to (surprise!) packet radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgable folks in radio digital communications can be found here, and anything in the general area is welcome.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.amateur.misc, .packet, and .policy groups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for details. You can also post to rec.radio.swap by sending email to rec-radio-swap@ucbvax.berkeley.edu; if you do it this way, be sure to include an address for responses by electronic mail, as the gateway does not automatically do so.

A Note on Crossposting
======================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

2696. new topic...#6 washers

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-15 13:26:16 UTC
From: jkeller@pica.army.mil
Message-ID: <9209150922.aa07668@COR5.PICA.ARMY.MIL>
Source record: 285280

Yes! I have been concerned for some time now about actually TOUCHING the #6 washers as I mount them under the nuts of my equipment. It's only logical that the skin oil deposited on the washers if I were to TOUCH them with my BARE fingers could cause Many Adverse Involved Diverse Symptoms (MAIDS) in my home-brew projects. So I use latex gloves at ALL TIMES when home-brewing, especially around chassi's. Who wants a chassi with MAIDS? By the way, I learned about this from my local garage mechanic who, by the way, says he doesn't WORRY about putting his batteries on the concrete floor because "it's clean enough to eat off of". Well, just let him find HIS batteries covered with MAIDS.....he'll sing a different tune, all right !! I'm glad I read this news-group so I don't HAVE to worry about all that.

A very grateful....Jerry, K1MER

>
>Please describe the weather conditions when you report TV DX; UHF
>propagation can be highly dependent on meteorological conditions.

Perhaps sci.astro should be deleted from the distribution list for this thread. My reason for introducing the topic to this newsgroup was that I thought the effect was a diagnostic for aurora. I was wrong, instead it is a diagnostic for the atmosphere. While this does not make the topic uninteresting, I think is makes the topic un-astronomical.

However, I gather that there is some interest in the topic. But discussion of equipment, and station identifications are appropriate for the radio newsgroups, and data including weather conditions may be of interest in the meteorology newsgroup. But I suspect (and will no doubt be corrected if I'm wrong) there is little astronomical interest in this topic.

>interference from strong stations).

This is true. A super noise figure or great MDS capability is not
mandatory for a great satellite receiver. The mast mounted preamp
is the essential tool that sets the ultimate sensitivity of the
system. However, it's possible to have a preamp that is too hot.
Too much preamp gain can depress the third order intercept of the
receiver enough to cause troublesome IMD products.

>Now, what is the dynamic range of the linear transponders of a

>dynamic range is useful in dealing with non-satellite
>interference, but I think its safe to assume that signals in a
>satellite pileup are coming through the transponder.

The problem is that not all the signals passed by the preamp are
coming from the satellite. In most urban areas the ether is filled
with strong VHF and UHF signals. Very selective networks can't be
tolerated before the preamp because of their insertion loss. Very
selective networks after the preamp further degrade the receiver
front end's S/N ratio to the point that the preamp has to be very

hot or the benefits of the preamp are wasted. Hot preamps generally don't have high intercept and are often unstable. The usual approach is to have a receiver with a very high intercept and little selective filtering between the preamp and the receiver. So very high dynamic range in the receiver is important. The IC275 excels here. The FT736R is good. On my old IC211 I used the Mutek front end replacement board for the radio. This board used the Mini-Circuits balanced mixer to replace the bipolar first mixer in the original radio. It also replaced the lossy PIN diode switching network with a Teledyne relay. These changes improved both dynamic range and S/N ratio of the unit.

Satellite pileups require very good IF selectivity to separate the closely spaced, and nearly equal strength signals. The IF filtering in most contest grade HF rigs is entirely adequate, but most VHF/UHF multimode rigs *don't* have these excellent IF filters. The FT736R is good in this respect while the Kenwood 790 sucks because high performance filters aren't available for the *subband* receiver.

In my old setup, I took the IF output of the IC211 and fed an IC745 in general coverage receiver mode. Using this cascade, I was able to take advantage of the superior filtering of the HF rig, particularly the IF shift and passband tuning features. The FT736R has IF shift and a notch filter, but lacks passband tuning. Often reducing the IF bandwidth from a nominal 2.1 kHz to 1.8, or even 1.6, kHz will make a dramatic improvement in readability of an SSB signal less than 10 db above the satellite noise floor. The availability of a really narrow filter for data and CW use is mandatory as well.

Naturally, a high intercept converter in front of an HF rig also works well. One advantage of this arrangement is that the preamp and converter can be integrated and mast mounted. The resulting HF IF reduces the requirements on the downlead. Ordinary double shielded flexible coax is sufficient.

It should also go without saying that superior phase noise performance is mandatory in all the local oscillators. Some synthesized VHF multimode rigs still have substantial phase noise, notably the Kenwood 711.

>lower and the noise is higher than on 2m.

Let me flame my own post!

When I say that the range is greater on 2m, what I mean is that
the practical range is greater for space wave/ground wave
and tropo. Antenna gain is usually higher on two, noise is lower
on two, and TVI is less of a problem on two than on six. Channel
2 TV is active is this area, so low power on 6m is basically a requirement.
VCRs especially tend to cause TVI problems.

I have found that for the same power with a ground plane
antenna, you get better range on 6m than on 2m. However, it is
easier to run higher power and higher antenna gain on 2m.

I certainly did not mean to flame 6m. I am a big fan of that
band. I wish it were more utilized.

2706. How do you count Germany for DXCC?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-15 17:07:31 UTC
From: cchapman@matd.gatech.edu
Message-ID: <cchapman.165.716576851@matd.gatech.edu>
Source record: 285287

I'm a little unclear about how you count Germany for the purposes of DXCC. I don't have the rules with me today but it says something to the effect that before some date (September 1972?) East and West Germany counted as the same country. After that date up until German Reunification, East and West Germany counted as seperate countries. Now that count as the same country again.

The question is how many times can I get credit for working Germany?

Four times? (Once before 1972, twice between 1972 and reunification, and once now).

Three times? (Once for unified Germany and once for East and West Germany)

Two times? (Once for East and West Germany, no extra credit for unified Germany)

I believe I have QSL cards for all of these German eras and I need to know how to apply them to DXCC credit.

Also, what was special about that date in September 1972 that they started counting East and West Germany as separate countries?

> something...)
>
> Thanks,

I strongly do not recommend powering any device from the phone lines. There
are several reasons for this. The first concerns automatic line testing
equipment. Telcos regularily test subscriber lines: one of the tests will
place
as much as 200 volts onto the tip and ring and measure current flow. The
purpose
of the test is to detect leaky cables, moisture infiltration, etc. If your
circuit draws current during this test, it could generate attention at the
telco, possibly causing a service call.

Second, a DC connection to the telco can cause problems if your circuit
should fail, say due to lightning, and feed current back to the central
office. The best case would be that the CO detects an external voltage,
opens up the cutoff relay and isolates your line. Of course, then you'd be
without service until either an automatic tests restores the line to
service, or a service person visits you and tells you to unplug your
device. The worst scenario would be that the external current damages the
CO line interface, which would place you financially responsible.

Keep in mind that connections to the public switching network are regulated
by FCC Part 68, and if your circuit ever fails you could be held liable for
connecting non-type accepted equipment to the network. I would recommend a
commercial interface circuit, such as the Dallas Semiconductor DS2249 Data
Access Arrangement Stik. (I have no vested interest in Dallas
Semiconductor; just happened to have a data book at my elbow.) This device
is covered by a transferable part 68 type acceptance. It runs off of 5
volts.

Good luck with your design.

Well, if strong UHF signals are such a problem, why is the 74.5 dB blocking
dynamic range on 432 MHz not a problem? (May 1990 QST review of the FT-736).
The 64.5 dB two-tone 3rd order DR isn't state-of-the-art either. I think
we even had another rig in to verify that the problem was the design.
By comparison, the TS-790 measured 111 and 81 dB. As I stated, these two
numbers don't seem to be that important, based on postings by both Gary
and Bob.

Dick Jansson WD4FAB claims in his September 1992 QEX article that a 0.15 dB
single cavity filter is acceptable ahead of a 0.3 dB NF preamp (for 435 MHz
satellite work). A kit for building cavity filters is now available
from Microwave Filter Co. 1-800-448-1666 for $70 plus shipping and handling.

Actually, you certainly can put a very selective filter in front of
a very low noise preamp and not lose much sensitivity. The high impedance
that GaAs FETs like to see at VHF/UHF for low noise figure is intelligently
accomplished by lightly coupling into a very high Q tuned circuit, such
as a cavity or low loss coaxial resonator. By doing this, one can obtain
a 0.3 dB NF preamp on 432 with great selectivity or a 0.1 dB NF preamp on
2 meters with good selectivity. And, if you really have a bad situation with
FM broadcast stations on 2 meters, undercoupling the input circuit often
yields the best system performance.

I don't understand why the filter placed after the preamp degrades the
sensitivity. Modern GaAs FETs and PHEMTs have so much gain that the problem
is usually getting rid of it. The hottest VHF preamps, using expensive

power GaAs FET devices, are usually biased with a lot of current (30 to 100 mA), so dynamic range is rarely a problem. Of course, using a $50 device instead of a $5 device to go from 0.4 to 0.15 dB at 2 meters isn't really worthwhile, unless you are trying to win a NF contest. I'm sure if my hot 0.13 dB NF/24 dB gain (measured 1992 Central States) had a problem it would have been noticed in the June VHF contest. K1TR/3 and W3CCX are only 18 miles apart--line of sight! Having two serious multioperator stations close together really puts a strain on the VHF/low UHF gear.

The instability with many preamps is from trying to used both tuned input and output stages--a broadband output circuit helps a lot. Also, many designers don't seem to realize that devices such as the MGF 1302 can be used to make 10 dB gain single stage amps at 10 GHz--it helps to make sure your design makes sense from DC to 20+ GHz . Its surprisngly easy to design microwave oscillators unintentionally.

2710. Need news from Kauai

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-15 18:03:48 UTC
From: jty@teal.csn.org
Message-ID: <jty.716580228@teal>
Source record: 285300

I am seeking an amateur radio operator who is able to contact another on the island of Kauai. I have not heard from friends and family in the community of Princeville since before the hurricane. If you are able to request information as to the extent of damage in this area and information as to the well being of individuals, I would appreciate you contacting me through email at "psc@neocad.com" as soon as possible.

Thank you,

psc@neocad.com

P.S. My site does not subscribe to this newsgroup and I am unlikely to see any responses posted here. Please use the email address above or the telephone number below.

2711. 46m Dish on EME

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-15 18:17:03 UTC
From: MROWEN%STLAWU.BITNET@cunyvm.cuny.edu
Message-ID: <9209151816.AA28112@ucsd.edu>
Source record: 285291

****

The Toronto VHF Society has received permission to activate the 46 meter (150') steerable dish at the Algonquin Radio Observatory. We (VE3ASO, VE3EMS, VE3CRU, W9IP & others) will use the dish during the ARRL EME contest (Oct 17/18 and Nov 14/15). The dish is located in grid FN05xw, north-west of Ottawa.

Plans are still being made. Our initial intention is to use the dish on 432MHz; later operation on 144 and 1296 MHz is anticipated. The dish is usable to about 30 GHz, so higher-band operation is feasable. The dish's pointing accuracy is 20 arc seconds and it is solid for the first 120' of its diameter.

Barring unforseen circumstances, we will be on the air at moonrise and remain active until moonset each day of the contest. We plan to transmit on 432.000 and listen both up and down frequency. We hope to use full legal power. The ONLY callsign will be VE3ONT.

Calculations predict that we will be able to work OSCAR-type antennas and 100 (or fewer) watts. No skeds are being accepted; all operation will be on random.

Please watch this space for further developments.

+>CW contests are still alive and well. We had both a CW receiving
+Yeah, I know about the contests at hamfests; what I want to know about are
+the contests which McElroy participated in, which I gather were a much bigger
+deal. There is a typical-of-the-period picture of him surrounded by
+trophies he had won. I assume these were contests for commercial operators.
+
+This got me to thinking about contests of skill for people in other
+occupations. It's been several years since I have read about a typing
+speed contest - the last one I heard about was won with a speed of 130 WPM
+or so. Maybe there were shorthand contests for stenographers at one time.
+The rodeo continues as a contest of cowboy skills. You just don't hear
+much anymore about contests where working people compete on their
+abilities. I'm not counting things like the Oscars and competition that
+a professional photographers organization holds, nor awards and honors,
+because in these things people are not competing against each other on
+specific tasks.

Years ago, there were programming contests. Each contestant was given
a task to code. Judging was on the basis of elegance, readability and
accuracy (if I remember correctly). Haven't heard of any in recent
years, though.

TeleCheck and other check verification companies are commercial outfits - i.e. you pay them money and collect the information they require, and they offer a measure of security (From conversation with a local merchant, I know at least one fully guarantees the check, if the merchant *exactly* follows certain guidelines - a few of which, coincidentally (NOT!), match some of Randall's rules of thumb - e.g. *valid* driver's license)

Since most hamfest sellers aren't full-time retailers, I doubt that TeleCheck, et al, would be a viable option. The averages (ref: Randall's statistics, for example) don't work out for them if you don't do a reasonable volume.

2718. ham licensing - finally!

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-15 20:31:32 UTC
From: Kirk.Smith@bbs.oit.unc.edu
Message-ID: <1992Sep15.203132.18222@samba.oit.unc.edu>
Source record: 285304

I just wanted to post a message to all the prospective hams out there.

I've been interested in radio for longer than I can remember. From listening to an old shortwave to playing with CBs and walkie-talkies as a kid. Within the past few years, I entered the field of Emergency Services, and found my radio interests soaring, at which time I got into scanning and radio system design. I've done consulting for municipal agencies on what freqs to program into their radios (not licensing and freq coordination, that's beyond my scope for now) and written the most complete scanner list for my county available.

But still...I never got my ham license. Oh sure, I always promised to. Bought the book ("Tune in the World"), but complained about learning code and didn't want to bother. Then the code free Tech came along, I bought "Now Your Talking", and still...couldn't get motivated. I've got my own business, do the radio stuff, emergency services stuff, and am also a full-time student. It was always so easy to say I didn't have enough time. Besides, I couldn't afford ham gear anyway, right? Wrong. I ended up buying a UHF handheld for EMS work, and will likely be getting a VHF handheld from an employer within a month or so for personal and business/emergency use. Everything ready to get on the air except the ticket.

I've been reading this newsgroup for several years now, and have picked up on most of the flame-wars here (ie: I know that if I swear on 2m while ordering a pizza on the autopatch from an airplane, the lights on the Sheriff's antenna must be lit or even the ham club gets fined, even if their batteries arn't sitting on concrete :-). This helped a lot with rules and regulations, and I've learned lots of good tech tips here.

So tonight I start an amateur radio licensing class offered through a local radio club. It meets every week, and I conned a friend into going with me. I'm pretty excited. I'll FINALLY be getting a ham license and be on-the-air.

I really encourage all of you lurkers to go out and find a club to help you out. I know how hard it is to get motivated to read the books and find an exam location when you've got a zillion other things going on in your life. I'm really looking forward to getting involved locally, and ragchewing on the local repeaters. As I get cash, I'd love to experiment with packet and ATV. It's so frustrating to listen to the hams talking on the repeater, and have them asking each other a radio question that I know the answer to, but can't reply! (usually public safety radio stuff).

So go out and get licensed. Sorry about the soapbox, but as you can see,
I'm pretty excited about finally doing something towards a ham license.

-Kirk J. Smith, EMT-P, MD2B, [Watch this space for a ham call!]

Gang,

thread is interesting.

i don't have the guys call, but for your information, the world record for continental morse is 100 wpm. this record was set by a W7 at the ARRL Convention in CA (W6 land) last month. from the email that i've gotten from others, the 100wpm record may not last all that long either.

for handwritten code copied at swapfests, there is a YL in CA that did 69.5wpm at one contest given by the above W7. from an observer at this contest, this was the only time the guy was visibly shaken. maybe that he thought he was gonna get beat before he got the record. :-)

surely somebody on this net was at the ARRL Convention and got all the facts and can give 'em to us before the issue of QST arrives.

there used to be a high speed tape used at cw contests at swapfests generated by W1NJM (no joking matter) for the Connecticut Wireless Association. i used to do 40wpm handwritten at swapfests in tests under less than ideal conditions. they discontinued the contest after the same three guys took the same three positions for many years. :-)

73 and bcnu,

2729. Finally!!! History of the word "HAM"

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-15 23:28:51 UTC

Some of you know about where the term "ham" came from. I was one who didn't, and even the ARRL text I used to study didn't know.

Anyways, I just read this on packet about 10 minutes ago. It says the story is verifiable.

Here goes:

From : N2JBO @ KA2MSL.#ENY.NY.USA.NA
To : INFO @ ALLUS
Date : 920913/0226

WHY RADIO AMATEURS ARE CALLED "HAMS"

********* From Florida Skip Magazine - 1959

Have you ever wondered why radio amateurs are called "HAMS" ? Well, it goes like this:

The word " HAM " as applied to 1908 was the station CALL of the first amateur wireless stations operated by some amateurs of the HARVARD RADIO CLUB. They were ALBERT S. HYMAN, BOB ALMY and POOGIE MURRAY. At first they called their station " HYMAN - ALMY - MURRAY ". Tapping out such a long name in code soon became tiresome and called for a revision. They changed it to " HY - AL - MU " , using the first two letters of each of their names.

Early in 1908 some confusion resulted between signals from amateur wireless station " HYALMU " and a Mexican ship named " HYALMO " . They then decided to use only the first letter of each name and the station CALL became " HAM " .

In the early pioneer days of unregulated radio amateur operators picked their own frequency and call - letters. Then, as now, some amateurs had better signal than commercial stations. The resulting interference came to the attention of congressional committees in Washington and Congress gave much time to proposed legislation designed to critically limit amateur radio activity.

In 1911, ALBERT HYMAN chose the controversial WIRELESS REGULATION BILL as the topic for his Thesis at Harvard. His instructor insisted that a copy be sent to Senator DAVID I. WALSH , a member of one of the committees hearing the BILL. The Senator was so impressed with the Thesis that he asked HYMAN to appear before the committee. ALBERT HYMAN took the stand and described how the little station was built and almost cried when he told the crowded committee room that if the BILL went through they would have to close down the station because they could not afford the license fees and all the other

requirements which the BILL imposed on amateur stations.

Congressional debate began on the WIRELESS REGULATION BILL and the little station " HAM " became the symbol for all the little amateur stations in the country crying to be saved from the menace and greed of the big commercial stations who didn't want them around. The BILL finally got to the floor of Congress and every speaker talked about the " ...poor little station HAM " .

That's how it all started. You will find the whole story in the Congressinal Record. Nationwide publicity associated station " HAM " with amateur radio operators. From that day to this, and probably til the end of time in radio: An amateur is a " HAM ".

No, the only thing limiting how often you endorse is how many times you want to pay $10 per submission (after the first one each year). On the other hand, with processing time taking 6 months, once a year seems like plenty often. Good luck! -David, ab9o

> Simon Woodworth.

There are some banks that have offered "check guarantee cards"
in the past, but this practice has been losing favor in recent
years. The cards were basically worthless to retailers. They
had a $100 limit (not nearly high enough) and also had
disclaimers and exceptions. We took several bad checks off
of these cards.

Well I don't know; but we're talking about the 1920s and 1930s when there was not much radioteletype, and all the ships at sea carried radio operators, and lots of places around the world were connected only by radio - no undersea cables. So there's lots of news, and stock market reports, and diplomatic traffic, and ordinary business messages. I believe the Western Union transatlantic cables were able to carry something like 50-100 wpm, and there was enough traffic to keep several of them busy. Passenger ships were the main means of travel - airlines just getting started - and passengers on a voyage want their daily newspapers; they weren't traveling on ships just for fun.

>won't likely be sitting on HF looking for those 255 degree beam headings, they
>will be concentrating on local communications to the other islands. In fact,
>I understand that much telephone service is already restored to Kauai.

Your criticism of Grady's approach is harsh. It's also fairly on target
for this particular emergency. In this case, local communications have
been virtually destroyed while international phone service still exists
to the island. The central office service works while the individual
lines to homes and businesses are down. Individual incoming health and
welfare inquiries cannot be handled expeditiously at this time because
there's no way to directly query the intended persons. On the island,
tactical communications between shelters and relief parties are occupying
most of the amateur resources.

It's frustrating to outsiders concerned about individual residents, but
health and welfare queries are a low priority because they are nearly
impossible to service due to the difficulties of contacting individuals
in the affected area with the local phone system out. Outgoing H&W messages
are best handled by local communications to either amateurs stationed at the
central telephone office or to amateurs on the other islands who did not lose
phone service. International HF communications is not needed or well suited
to servicing these messages. If the message's priority is so low it doesn't
warrant a collect call, it's not a serious message IMHO.

Now that's *this* disaster. The Mexico City earthquake was different. There, international lines were destroyed by the collapse of the phone exchange downtown, but most *local* phone service still worked and many areas of the city were relatively undamaged. I was able to relieve the fear of a meighbor whose family had hosted a Mexican exchange student in a matter of minutes. I merely got on 20 meters, called a Mexican station accepting incoming H&W traffic, gave him the name and phone number of the family, and waited while he called them and found that they were all in good health.

I would note that the neighbor had first called the local Red Cross who had taken their request for information and given it to the amateur NTS. The neighbor received a service message, by mail, two weeks later to that query stating that the message could not be delivered by the traffic network. Fortunately, he blamed the Red Cross and not amateurs in general since an amateur *had* been able to deal with his communications emergency in a timely manner.

As someone who was net control of a traffic network, and who handled many phone patches in the Vietnam era, I was ashamed of that response. Fortunately I had been able to help my neighbor in spite of the NTS system. The system *should* have worked, though slowly, but it did not. Several Stateside traffic handlers wound up with piles of undelivered messages. Some just dumped them while others had the courtsey to send service messages back reporting delivery failure.

Our international message handling system is totally inadequate to handle the kind of volume produced by disasters of this nature. It took us a couple of *years* to gear up to handle the volume of traffic generated by servicemen in Vietnam. Today most of that capability has decayed and can't be rebuilt in a few *days*.

Dave,

Fortunately, Chris is a close personal friend and I knew what he was trying to say. Yes, if you live in England you are prohibited by law to listen above 146.00. 146.00 to ??? is the police band in London, based on the last information that I recall from Chris. (Peter, do you care to elaborate???) We here in the US enjoy the greatest on freedoms with regards to receiving our airwaves. Do you realize ("realise" for the Brits) that in England that you have to buy a annual license to receive TV. I think it cost the equivalent of about $150.00 per year. There would be a march on Washington DC that would make the civil rights era look tame by comparison if the FCC tried to implement that system!! Then again maybe apathy is already set in stone. :-) ;-) |-)

>feed on the sleeve instead of the tip. Why can't manufacturers
>agreee on a common standard for these things?

Not a dimwitted idea at all. I (and others most probably) have investigated the idea. The problem is that the Power Socket has a Normally Closed switch on the postive (outer conductor) side. In normal operation the switch is closed and power from the battery powers the HT. With the external power cord inserted, the battery is disconnected and external power runs the HT.

You cannot easily swap things around and disconnect the negative side of the battery instead. The negative contact for the battery is connected directly to the chassis, which as I pointed out earlier is negative ground. The mechanics to isolate the contact are not easily achieved (but not impossible).

I should point out that there is a diode in series with the negative (center) conductor of the power socket to protect the unit from polarity reversal. Similarly there is a diode (shunt) to protect the battery as well. Good engineering practice requires a fuse of the correct size on the power cable itself to protect from shorts due to accidental ground contact or worn cable insulation (that goes for power cable of either convention).

Also the Standard batteries themselves have a power connector for charging.
[They will not charge on the radio with external power supplied.]
[I do indented to modify it to do at least a trickle charge.]
I have not opened any of my batteries open yet to see the internal wiring. It may just be a diode for protection and a resistor to limit current. In any

case, cracking open each battery to reverse polarity is not my idea of fun modification.

My Icom SAT appears to have no reversal protection in the inital stages after the power connector (according to schematic in the service manual). The PRT unit (board), which controls the charging of the batteries is apparently unprotected. The rest of unit is isolated via a series diode. This won't help alot if the PRT or battery unit catches fire.

I guess I really should be worried about the Icom.

In any case, I wouldn't let this stop anyone from getting the Standard. IMHO, the Standards are better in many categories than the rest.

If anyone out there with a Standard has made the modification to the power connections, I'd be interested in hearing about this.

Simon,

In the US this would result in guaranteed fraud!

In europe there are several high speed cw clubs,
HSC = High speed club = 25WPM
VHSC= Very high speed club = 40WPM
SHSC= Super high speed club = 50WPM
EHSC= extremely high speed club = 60WPM

to become a member you have to be able to send and receive
morse code at the above listed speeds.
"Send" means sending CW without a keyboard, you have to
use some sort of paddle.
"Receive" means to be able to understand fully what the
station on the other side is transmitting, without
the help of any decoding device other than your brain.

You have to run into some members of the clubs on the HAM bands,
QSO them a couple of times including a QSO which lasted
at least 30 minutes, and ask them for a recommendation for the club.
When you have a certain number of recommendations
(5 HSC,4 VHSC,2 SHSC/EHSC) you can apply for membership.

HSC has about 1600 members, VHSC about 400, SHSC about 130, EHSC about 70.

There are annual meetings in Baunatal, Germany, at Eastern.

That's also the place where the speed contests take place:
there are several categories,
sending letter groups, number groups, mixed letter/number groups,
plain text.

Receiving all of the above.

And one - which is the most fun part for me -
is receiving sentences of plain text (80 characters max. each).

Listen to them, write them down afterwards.

5 sentences per speed are sent, 3 of them have to be
copied correctly.

The trick about the whole "listening contest" is that you
have to know the language and words sent!

In 1989 we had easy sentences which made DF4PA and me winners
at 76 WPM.

This year I had to leave the field at 50 WPM already because
the organizers of the contest switched to english
language and picked difficult sentences from a book for
electrical engineers!

here in the UK, Radio Hams tend to be known as Radio Amateurs.

(I prefer to be called a Radio Amateur not a Radio Ham - I indulge
in radio on a non-professional basis -it's only a hobby)

The term HAM has been used for many years as a pseudonym for AMATEUR
and has it origins before Amateur Radio. The term HAM ACTOR has been
with us for along time meaning an actor who does it as a amateur.

I can't possibly believe your story. sorry & 73

Thats right. Many countries, at least in Europe, have very strict regulations
on what you are allowed to receive. For instance here in Denmark, the only
frequencies above 30 MHz you are allowed to receive without speciel
permission is the broadcast and amateur bands. It's even illegal to
possess a receiver capable of receiving outside these bands.

Thanks. I'd been wondering why the "HAM" and "Now You're Talking" certainly didn't say much on the subject. I've been bogged down learning the theory and the regs (telling myself all the while in a pumped-up voice: "I will, I will!) and it's nice to hear things like that.

I thought ham-radio lovers might find this story interesting. It's mostly about hurricane Iniki (as experienced on Oahu, which only got a good scare), but ham radio enters into it.

(My apologies to anyone who already saw this on sci.geo.meteorology. I've had a very hard time getting this to post! I've been trying for several days. If it fails this time I'm giving up.)

Sun Sep 13 02:42:53 HST 1992

The previous week people here had been joking: there are three Hurricane warning centers in the United States, in Miami, Guam, and Honolulu. Miami and Guam have both been hit in the last 2 weeks. Obviously we're due! Hah hah. Hawaii only rarely gets hurricanes; the water around the islands is too cold to support them and the prevailing winds keep them south. But the last week we had a real record-breaker hot humid spell. Disgusting Houston weather, made worse by a plague of tiny black bugs that wanted to crawl all over you reveling in your sweat. (It didn't help that the bugs look like miniature black versions of the thing that crawled in Chekov's ear in "The Wrath of Khan".) And the water offshore is warmer than usual from the El Nino, just hot enough to keep hurricanes growing.

Thursday morning we were alerted to be careful of big South swells, caused by a hurricane passing by. Lots of people rush off to the beach to take advantage of the waves.

Thursday afternoon the radio started reporting that a hurricane that had been expected to pass well to the South MIGHT turn North and pass to the West of the islands.

I was up late Thursday night working on a paper. Finally finished the damn thing after months of off-again, on-again sweat, and I wanted it to be DONE! But it had gotten too long and needed some trimming, and that's what I was doing. Turned on the news for a break, and they were saying that Oahu was now under a tropical storm alert. Next hour it was a hurricane alert. Oahu could get nailed if the hurricane continued to arc East.

At 2AM I decided this needs to be taken seriously, so I started a complete file backup on my system and gave John S. a call. He's a local ham-radio fanatic whom I met through the Hawaii Astronomical Society, who's usually up at 2AM anyway. He hadn't heard about the imminent hurricane yet. I happened to almost be out of clean clothes (Gerard had once warned me that after Iwa they couldn't wash for a while, and they ran out of clean clothes) so I left a load going at John's apartment while we went out shopping

for emergency supplies: some canned goods, extra batteries, and tape.

There were lines in the store! The big Safeway was nearly out of batteries and tape at 2:30AM. I noticed they were also nearly emptied of toilet paper. Only the extra-soft beautiful-pastel-prints fresh-scent kinds were left. I did not realize people used "Just in Time" stocking techniques for this vital necessity, but I guess many must. They were also out of regular candles, and were now selling out of big votive candles in glass vases with images of the Virgin and Jesus and Buddha on the front. (I was a little surprised they didn't sell out of those *first*.) The person in front of us in line was obviously worried: she had bought a stack of every kind of checkout-line magazine they had: National Enquirer, Star, People, along with some bottles of wine. The store clerk reminded her that under Hawaii law alcohol could only be bought between 6AM and midnight and took it back.

I went back by my office and dropped the emergency supplies off, and gave my mother a quick call before the long-distance lines to the mainland filled up. (She's the worrying sort.) I told her "You haven't heard about this yet, but a hurricane is bearing down on Honolulu. Don't worry, I AM FINE. I am not going to try to weather the storm in my pathetic termite-eaten $450-a-month dirt-cheap shack. I will be in my office and it is a good place." She didn't want me to go home to sleep. I MIGHT not wake up until I was already dead! I should be careful! I SHOULD PANIC!

The sirens were supposed to go off at 5AM; I figured I'd let them go off and then catch a couple hours of sleep. Unfortunately, the sirens did NOT go off at 5AM. (I found out later they pushed the button but nothing happened the first try.) I went to sleep anyway, only to be rudely awakened by sirens at 5:27. I turned on the radio. All the stations were broadcasting the same thing: "This is an Oahu Civil Defense Emergency Broadcast System announcement. During the night hurricane Iniki has turned towards the North. All residents of Oahu should begin taking emergency precautions, and should prepare for evacuation if so ordered. More detailed instructions will follow later. All off-duty hospital workers report for work. All city, county, state, and federal offices are closed except those needed for emergency work. All public schools of all levels are closed." I felt sorry for all the people who were just now hearing about this. They were going to find the stores already stripped by the night owls.

I wandered outside. It was very strange to see every house with its lights on an hour before sunrise. So many houses had radios playing that you could walk down the street and hear the entire announcement without a break. The sirens had jolted my nerves awake so I decided to just stay up. Besides, this was sort of interesting and I didn't want to miss the complete experience.

My shack is a rather pathetic structure of the kind common in Hawaii, completely termite-eaten. Putting boards over the windows would be kind of pointless: the nails would no doubt rip out of the rotten window frames and the boards would become just more projectiles. And what to do about the two "windows" that consisted of permanently mounted slats of wood,

with no provision at all for closing? And I had doubts as to whether the roof would stay on if the wind got to 100MPH. Since my possessions are few, I just took everything of little value and wrapped them up in plastic garbage bags. My futon I rolled up and stuffed back into the plastic bag it came in. Most of my books were already at the office. (I've found that books left at home tend to get eaten. The bugs are gourmets: they like to drill holes perpendicularly through the book from cover to cover so they can get a taste of every page. Not to mention the time I discovered a very poisonous centipede in the shower while bathing... but I digress.) Fortunately the trash men arrived just as I was trying to figure out what to do about the mountain of stinking trash left there by the next-door neighbors. The trash cans I put in the crawlspace under my apartment, lest they become missiles.

There! I may become homeless, but my stuff ought to survive!
I figured my bike could ride out the storm well enough at home.

Outside the Bul-buls, Mejiros, and Zebra Doves were all making their normal sunrise noises. They obviously didn't know what was coming. The poor, ignorant beasts! Certainly there wasn't any hint of catastrophe in the air; just the abnormal heat and humidity coupled with wind from an unusual direction, the SouthEast. It wasn't even raining. I could just imagine the day after the catastrophe how the birds would be muttering to themselves: "Those humans were acting peculiarly yesterday! They were all up before sunrise, and seemed so agitated. I didn't pay it any attention at the time, of course. They get excited about all sorts of stupid things. But now I remember that they were all outside their nests putting X's in the windows. Very strange. And they mobbed those special places they have for gathering food... and they never do that at sunrise. Their fast-but-don't-fly death projectiles were undangerous, chirping and unmoving in lines all around the food places. Those humans must have a special sense about the weather that we birds lack. If only we could understand how they do it."

I drove to the UH parking structure to hide my car deep in its guts. They had a guard manning a barricade blocking it off. "No work today! Go back home and get ready for hurricane!" "My computer in my office is a lot more important than anything at home, and I figure my car is a lot safer in the parking structure than on the street. Can I just leave it here?" "Sounds reasonable to me, go ahead."

Over at HIG everyone was gathered around the meteorology department offices on the 3rd floor. The meteorology profs had just escaped from the newspeople, who had woken them up at home at 4AM, and were examining the real-time weather satellite images as they came in. They were dark and hard to interpret because of the dim dawn sunlight and the difficult perspective on the islands which are near the limb of the Earth as seen from the satellite's location. The meteorologists were playing connect-the-dots with a felt tip pen on the monitor screen, tracking the eye. Every now and then they'd give impromptu lectures to the students eagerly gathered around, and complain to each other about how pathetic it was to have to track a hurricane bearing down on a major population center with such imprecise tools. The interpreted maps showing air flow, sea surface temperature, etc, from Miami were all several

hours old. What are they doing over there, taking a vacation?

Why don't we use our own weather radar to track it, I ask? What a stupid question! _WHAT_ weather radar?! Hawaii DOESN'T HAVE ANY WEATHER RADAR. In the late 90's (or so) Hawaii is supposed to get the fabled NEXRAD system.... the NEXt generation RADar, which will do all things for all people (but only if you BELIEVE and CLAP YOUR HANDS.) And why install anything now when NEXRAD is coming?

First they thought Niihau was going to get it. "Pele's revenge for the haole owners of a Hawaiian island suspended in the 19th century." Later the dots started lining up somewhat to the EAST of Kauai, in the channel between Kauai and Oahu. Uh Oh ... Well it's hard to tell, maybe just the eye cycloiding around... it's probably still actually heading due North, towards Kauai.... At that point one of the profs says "It's enough for me! I'm going home to batten down! Good luck. BYE!"

Can't do any work... they've pulled the plug on the computer network. I reboot my sun single user but decide I'm not really in the mood to work today after all. I decide to go home and rescue my bicycle. On the way out I notice a visiting professor from Japan sitting in his office, working as usual. I knock on the glass and indicate to him in slow, simple English (with hand gestures) that the building is empty because a hurricane is coming. He says he heard sirens but ignored them.

While I'm biking back to the office at 11AM or so the sirens go off again, to announce where emergency shelters have been set up. I hear the message pouring out of every radio in every home: Everyone in tsunami inundation areas (listed in your phone book) must move inland, or into 3rd floors or higher. You are not allowed to take pets to shelters. Leave them locked in cars, or leave them inside apartments. Do not tie them down. Especially do not leave animals tethered outside. Make sure they have name tags and addresses firmly attached.

It starts to rain, then to blow. Then it begins to blow harder. The radio says Oahu is expecting 100MPH winds within 5 hours. DO NOT PANIC... there is still plenty of time to get ready. Do not do anything stupid. Take a deep breath and collect your thoughts before acting. But get ready. NOW. Thinking of Homestead, Florida, I get back to the office and start taping up my office windows, and moving books and computer further inside. The birds outside my office start making distress noises.

John calls. As an official ham "RACES" operator, he's supposed to go help the Civil Defense with communications during emergencies. Do I want to go help him by playing gopher? Sure, sounds interesting! While I wait I watch a reporter talking on TV live from Civil Defense. John arrives. We drive over to downtown, dodging the fallen palm branches lying everywhere, and trying not to be thrown out of our lane by the wind. Most stop lights are out. The mayor is being interviewed outside --- I notice he's picked an especially windy spot next to the building, so the wind can impressively blow through his hair for good effect on TV (elections are just a month away, after all). We go down into the basement to report for work. It's easy to see where to go:

just follow the hundred-yard-long cables snaking down the stairwells from the news trucks parked outside.

The tiny room is swarming with people. We are forced to bump into the very reporter I had just seen on the TV in my office; he's still talking. (I resist the urge to wave to the viewers at home.) There is a BIG WHITE BUTTON on a desk marked "master siren control". On the walls are all sorts of maps. All around the room are consoles, with people talking into mikes and listening to headphones. We find the right one who is sitting there not doing anything, and introduce ourselves. WHAT? HAM RADIO OPERATORS? We don't know what to do with you! Very noble thought, and all that, and I suppose we ARE _supposed_ to be making use of you guys like that... but we're not going to. We're too busy. I suppose we may need you after the storm... go wait somewhere out of the way. We'll call on the radio if we need you.

I suggest we go back to HIG. On the way I notice all the high-rises are decorated as if for anti-christmas. Instead of colorful lights and season's greetings, there are big X's in every window. Some heretics prefer plus signs, others asterisks, and a few carefully laid out grid patterns at various orientations. Quite a few optimists (or absentees) have done nothing at all.

Upon arrival we find that half the offices in HIG have people in them who have decided it's a better place than home to ride out the storm. It's a veritable hurricane party. We set up in the terminal room with food, sleeping bags, boom box, ham radios, and TV. We make occasional trips to the third floor for real-time analysis of the storm's path from our very own staff of meteorologists. Meanwhile John monitors the ham radio bands for reports. Since we expect the power to go out I try to eat all the perishable food I rescued from my refrigerator at home: milk, chocolate milk, and 3-day-old Kentucky Fried Popcorn Chicken. (Is there any chicken in there? It seems to just be grease and breading.)

Outside its blowing, but nothing really serious. Doesn't even rain much. It's as if a stage were set for some dramatic show, but when the time came for the climactic third act all the actors just got tired and went home instead. Our personal weather staff says it's going to mostly miss Oahu... It will pass about 100 miles away. The eye is contracting, the hurricane is spinning up.... which is slightly better for us, a good way away from the center, and a lot lot worse for Kauai which is now dead in the path. They say "The pictures from Kauai tomorrow are going to be very tragic. This hurricane has winds twice as strong as Hurricane Iwa ten years ago did, and energy (and damage) goes as velocity squared. And the buildings in Kauai are built like crap. This is going to make Iwa look like a cakewalk."

The eye passes by us to the West while we watch the Leeward coast being pounded by waves on TV. Someone says "now's when we get to laugh at all the rich people with their expensive beach-front homes". The weather analysis and photos on TV run about 30 to 45 minutes older than the ones from the 3rd floor, so we pretty much ignore that. The TV reports that all communication has been lost with Kauai, _nobody_ knows what is happening there. The _civil defense_ doesn't even know.

Meanwhile we listen to ham radio operators on Kauai --- they say things like "waves are breaking over the breakwater in the harbor, boats are being tossed everywhere" "major structural damage is now occurring in Lihue". We also hear hams on Oahu report that three waterspouts are dancing around just off the North shore. Hams on Maui report that the wharf area in Lahaina is taking severe damage.

Just for fun I tune to WWVH, at Kokee, Kauai, which is centered just about smack under the eye of the hurricane with 160 MPH winds at this time. Still broadcasting: "at the tone, the time will be..."

Shortly after the eye leaves Kauai, we hear a Kauai ham asking for somebody on Oahu to get the governor on the phone; they've got the "mayor of Lihue" and she wants to talk to him. We go outside and sit at a picnic table for better reception. It's stopped raining; the sun is even starting to peek out. After a while Governor Waihee gets on the line... he says "Hi. What's up?" The mayor of Kauai county says "how is Oahu? Did you get severe damage?" "No, just a little. How are you?" "It is absolute chaos here. The air is full of stuff being blown horizontally. Part of the roof of our civil defense building has come off. Our entire phone system is down because of broken phone poles. We need generators, communications, everything you can send us. This is the worst disaster in Hawaii's history. We need you to call the president to declare our county a disaster area immediately. We've already started the paperwork here." "We'll start it here. OK."

We go back and confer with the meteorologists on the third floor. Everyone is packing up and going home; we've missed it. The official all clear comes at 5PM. On the TV they are still saying "we have had absolutely no word from Kauai since 1PM. Neither does the Oahu civil defense. We, like you, can only guess what is happening there..."

I yell at the TV "speak for yourself!"

I go home, unpack my futon, and collapse into it. I feel a bit like a fool. Stay up all night preparing, just to take it all apart again a few hours later. Didn't even lose electric power. On the other hand ---- but for the whim of a few winds steering a gigantic storm, I could be camping out in my office for the next month, Homestead (and now Kauai) style, with roads all clogged, everything closed, no power, no phone, NO WATER, many possessions wrecked... I guess I'm sort of glad I got to experience a hurricane, but this one was big enough that I'm also quite glad it didn't nail _me_.

Ham radio reports filtering back from Kauai speak of incredible devastation. One ham reports "I'm living at my neighbor's; his house survived the collision with my house's roof." 90% of all phone/power poles are snapped off and blown away. One month, minimum, until most parts of the island have power again. John is busy now calling people on the mainland and elsewhere in Hawaii with messages from relatives on Kauai.

Do you think Bush will fly out to Kauai like he did Florida? Not very likely ---- Hawaii's a democratic machine state with only 4 votes in the electoral college. My guess is that Bush is lacking enough in "the vision

thing" to appreciate the long-term benefits. By _not_ visiting he's making absolutely _sure_ that Hawaii's going to stay solidly democratic for some time more to come.

Well, I've got _work_ to be getting back to. Speaking of which...

2749. JOTA frequencies

With this year's Jamboree-On-The-Air a month away, I thought
it would be useful to remind participants of the frequencies to use.

Generally, any Amateur frequency can be used.. just call "CQ JAMBOREE",
or answer Scout stations who are calling to establish a contact. If you
cannot find another Scout station try calling on the recognised Scout
frequencies listed below: (Note: Some countries will have their opening
ceremonies in these frequencies.)

Agreed World Scout Frequencies

BAND CW SSB
80m 3.590 MHz 3.740 MHz
40m 7.030 MHz 7.090 MHz
20m 14.070 MHz 14.290 MHz
15m 21.140 MHz 21.360 MHz
12m 24.910 MHz 24.960 MHz
10m 28.190 MHz 28.990 MHz

Also worth listening to in the UK
2m 144.325 MHz SSB
2m 145.325 MHz FM

I'm looking for skeds with Canadian and US JOTA stations around 2100 GMT
Saturday 17th October, on 15 or 20m. Our call is GB2PL.

Is anyone else getting sick and tired of hearing that Mickey Baker is no longer with Data General? Who was this guy, and why is Randy Giordano at (305) 486-2000 taking correspondence and questions about the guy?

Yo: Data General - Get a life!

This is true, however, 146 MHz and up is used for PMR (at least in GB), and
so finding a frequency which would not interfere with PC Plod from South
Norwood Nick could be tricky!

I found a manual for the Yaesu FT-101E/227E SSB transceiver in a
box of old magazines I acquired at a recent hamfest, and according
to the table of contents, it appears to be complete except for
missing the front cover. I have absolutely no use for the manual.
If anyone wants/needs it and is willing to reimburse me for postage
(at 37 pages, a buck ought to cover it), please let me know.

2758. Alinco DR 112 and AEA PK232: It always stops working...

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-16 18:30:18 UTC
From: jrs2p@amsun.apma.Virginia.EDU
Message-ID: <1992Sep16.183018.25646@murdoch.acc.Virginia.EDU>
Source record: 285238

Does anyone know if a special cable is required to connect an Alinco DR 112
to an AEA PK232?

I constructed a cable as described in the PK232 manual for the DR 110 -
which is just a straight-through cable.

Everything worked fine for several weeks until one day the radio stopped
working. It would neither receive nor transmit (the 'on air' notice did
show up, but the 'power out bar graph' did not indicate any power out.

I double checked everything, including the antenna - it all looked fine.
I disconnected the TNC and hooked up the mic and still nothing worked.
The next morning the radio worked fine with the mic but as soon as the
PK232 was connected and tried to transmit the radio stopped working.

The radio went to the shop, and after sitting around for a week it was
finially examined. Needless to say everything worked fine.

I got it back last week and it worked fine both on voice and on packet;
until last night. This morning it worked again with the mic but as soon
as the TNC was hooked up it stopped working.

I'm beginning to think that the cable for the DR 112 might be different
than the one for the DR 110. Or perhaps something is wrong with my PK232.
Any help would be greatly appreciated.

The following piece about Richard Burton, ex-WB6JAC, appeared in the Tuesday, Sept. 15 LA Times, Metro section, pages B3 and B4.

Randy Cole
KN6W

Ham Operator Who Makes Waves on Airwaves Faces New FCC Charges
by Bob Pool
Times Staff Writer

Legend has it that Richard A. Burton's problems started at church with Ronald Reagan.

By one account, the amateur radio operator made an obscenity-laced shortwave broadcast that was somehow transmitted over the loudspeaker system at the Bel-Air church where the president-elect was attending Sunday services in 1979.

By another, Reagan heard a snippet of Burton's raunchy, on-the-air comments when a Hollywood film producer cornered him after the service and played a cassette tape for him.

Both versions suggest that Reagan got an awful earful that day -- enough to prompt 12 years of wrangling between the Federal Communications Commission and Burton. The dispute has landed the ham operator in federal prison once and now threatens to send him there again.

Burton was ordered into U.S. District Court in Los Angeles Monday morning to answer new charges that he violated FCC regulations by broadcasting without a license. The allegations are certain to further complicate Burton's effort to win his ham license back and, at worst, could land him once more in prison.

"I've never seen the ham community as divided on anything as it is on this," said John Brunk, a Norwalk medical technician and amateur operator whose friends have taken sides in the matter, often arguing over Burton's case on the air.

Foes of Burton have flooded the local FCC office with phone calls and letters demanding that he never be relicensed. They claim he continues to illegally broadcast the same profanities and epithets that first got him in trouble.

Supporters of Burton have contributed money to help him hire a lawyer to win his license back. They contend that he has harmed

no one and is a victim of a government vendetta.

Ham Anthony Cardenas, a Carson computer consultant campaigning to keep Burton off the air, says that "he's served his time, but he's not a changed man."

Ted Krempa, a Mission Viejo insurance man who has donated $100 to Burton's defense, counters: "This is about a hobby, that's what's kind of silly.... what harm can a person possibly do on ham radio?"

So far, the FCC has steadfastly refused to issue a new operating permit to Burton, 48, an electronics engineer who is disabled by heart and respiratory problems. A licensing hearing scheduled for last week was abruptly canceled when an administrative law judge ruled that Burton's past convictions -- coupled with a missed deadline for his paperwork -- nullified his application.

The new indictment filed Monday alleges that Burton made illegal transmissions on May 5, May 20 and July 6. Burton pleaded innocent Monday. He was ordered to return for trial Nov. 10.

Burton said Monday that he plans to appeal the license ruling to an FCC review board and the agency's commissioners if necessary. If that fails, he as vowed to sue the government to get his license back.

He says that what started as a hobby has become a compulsion that has affected him mentally and physically. Stress from the FCC dispute caused his weight to balloon to 480 pounds last year, he said.

"I just want to talk to my friends on the radio," he said. "It's been a hard 12 years. Every day I've dreamed of getting my license back. Ham radio is my life, my fellow radio amateurs are my family. Radio is my contact with the outside world."

"I've served my time, paid my fine, served my probationary period. I've undergone the court-ordered therapy that was required. I'm rehabilitated, in terms of talking dirty on the radio. I won't talk dirty -- unless I'm provoked."

But Burton acknowledges that it was his mouth that got him in trouble in the beginning. He admits he sometimes used "barroom language" and interrupted other amateurs' conversations in the late 1970s.

"That built the fire," Burton said, "It's been downhill from there for me. Of course, I didn't help matters."

When the FCC ordered him in 1980 to watch his language, Burton brushed the warning aside. After that, when the FCC suspended his ham license, Burton kept talking.

He was convicted in federal court in 1982 for transmitting without a license and broadcasting obscenities -- although the obscenity conviction was overturned two years later.

In 1984, Burton was sentenced by federal Judge Manuel L. Real to four years in prison on the license charge. All but six months of the sentence were suspended and he was placed on five years probation.

"I spent six months, 20 days and eight hours in Lompoc," Burton said. "Other prisoners couldn't believe it when they asked me what I was in for and I told them, 'For talking on the radio.'"

Burton immediately applied for a new ham license when his probation ended in 1990. But before the government acted on the request, FCC investigators again caught him talking on the radio without a license. Burton avoided a return to prison by pleading to federal Judge Robert M. Takasugi for "forgiveness and mercy."

"I don't expect the FCC or the amateur radio community to welcome me back with open arms, but I hope that some day they can show some compassion to one who has gone astray," he wrote Takasugi.

Burton was fined $2,000 and placed on another year of probation. When that period ended last fall, he applied again for a new license.

But his detractors say he again picked up a microphone earlier this year without waiting for the FCC to issue him a new permit.

Amateur operator Mel Goldstein, a hydraulics company manager from Thousand Oaks, said Burton recently interfered with Ventura county hams' transmissions and uttered ethnic slurs over the airwaves -- an allegation Burton denies.

"That guy doesn't deserve to be licensed," Goldstein said.

Ed Walker, co-founder of the Baldwin Hills Amateur Radio Club, said that "it's ridiculous to go to jail for talking on the radio. But he asked for it. Richard hasn't reformed."

For his part, Burton says he is not guilty. He said a friend now has possession of his radio equipment. "It's like candy -- I want it locked up and out of my reach," he said.

Burton's supporters say he has been punished enough.

Ham Mike Foster, a Mission Viejo electronics technician, said many of Burton's critics have never heard him on the air. "They've heard of him. Automatically he's a terrible guy because he went to prison," Foster said.

Hal Hileman, a Palm Springs engineer, agrees with other Burton backers who say that since the controversial ham has served his time, he should be considered rehabilitated.

He was a boyhood friend of Burton in Eagle Rock when they were Cub Scouts. Both became interested in radio by building an old-fashioned crystal set together.

"I'm a traditional kind of ham, conservative on the radio," Hileman said. "But I can't see any justification for holding back his license. It's clear to me there's a lot more going on between him and the FCC than just breaking the law."

Ralph Haller, current chief of the commission's Private Radio Bureau, said the Burton case was simply triggered by FCC investigators who picked up on complaints.

"We're always facing a very delicate balance between freedom of speech and yet allowing something on frequencies that can be heard internationally," Haller said from Washington before Monday's indictments were announced.

I have either heard Ham or Radio Amateur, not Radio Ham.

>The term HAM has been used for many years as a pseudonym for AMATEUR
>and has it origins before Amateur Radio. The term HAM ACTOR has been
>with us for along time meaning an actor who does it as a amateur.

I understand the term "ham" has applied to acting before amateur radio, but I wasn't aware of it being a pseudonym form amateur in terms of acting (I do believe it is probably the case with radio), but rather a "ham" was an actor who tended to be quite proud of themself and 'played' with the audience.

>I can't possibly believe your story. sorry & 73

I doubt the story is the real history of where ham came from. It was not my story, as was clear in the forwarded message. That person claimed it was verifiable. The names are can probably be verified, but they are one of the major points that sounded a little fishy (antenna tuna thread :) to me.

73,
JT N8PUY

Source record: 285239

I am looking for a 2m/440 mobile transceiver small enough to fit
in the ash tray slot in my 1991 Toyota Corolla DX. This means it
needs to be about 4-1/2 inches wide by 1-3/4 inches high. It will
be used in a metro area so output power is not an issue. I don't
necessarily need a new rig so if you know of a rig that is no longer
available new that is ok too. BTW, depth of the rig is not an issue.
Any thoughts?

Re: Batteries & cement

Amazing. Even here we have difficulty .....

Theory 1: heat transfer thru the battery case to the (practically) infinite
heat sink of the concrete depresses the temperature of the
whole battery and thus its capacity.

Theory 2: Residual acid on the case of a dirty battery can complete the
connection via some slight conductivity of the concrete and
thus discharge the battery. (Consider acid-slime down the
vertical sides from the posts and making the connection across
the bottom in the concrete's surface conductivity - if any.)

Theory 3: Some mystical property of concrete which, like UFOs, causes
electrical devices to malfunction in its presence.
(Are UFOs made of concrete?????)

Personally, I like Theory #1.

My house painter would probably also add that sitting on concrete gives
you hemorrhoids. So he always puts plastic sheeting between himself and
concrete. Works for him!

Batteries and buttholes; separated at birth!

2770. How to get rig and computer to coexist

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-16 21:44:58 UTC
From: brosen@BBN.COM
Message-ID: <lbfamqINN2j0@news.bbn.com>
Source record: 285241

I'd be interested in hearing suggestions and user experience with regards to using a PC clone in the ham shack. The problems I've experienced are the obvious ones: 1) video noise getting into the receiver 2) if the two are actually physically connected (like when using AEAFAX), lots of computer noise getting into the receiver 3) occasional transmitted RF getting into the computer.

Rig is a TS850 ... computer is a brand X PC clone (but I've had similar symptoms even with True Blue PCs).

What have people done to minimize these effects?

Thanks in advance!

Bruce Rosen (brosen@bbn.com)

A plausable story I heard recently go`s like this;
The the January 1912 issue of a magazine called Home Amateur Mechanic was devoted entirely to the radio expirementer. Thus the term HAM was born.
Couldn`t prove it by me since I was not around that month.

Others have mentioned SuperMorse (I personally prefer the older version,
but hey, I'm a little strange :-).

So, I'll mention MorseAcadamy, from the WY5I group. It allows you to
practice type-behind, among other things. I use both now.
It does have ONE minor problem - it sometimes "stutters" (timing
gets messed up)....

If it is not available on an ftp site somewhere, I'll happily uuencode
it and mail it to ONE person to put it up ftp-able. (I will probably
also submit it to c.b.i.p.c sometime).

2779. Richard Burton in LA Times

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-17 04:22:08 UTC
From: julian@bongo.UUCP
Message-ID: <615@bongo.UUCP>
Source record: 285197

On Tuesday Sept 15 1992, the LA Times (The world's worst newspaper) Metro Section) ran a story about Richard Burton, the bad boy of amateur radio.

The story covered two pages because the layout people at the LA Times still haven't figured out how to finish a news story on the same page they started it.

According to stuff I heard on the "435" repeater, he was interviewed a few weeks ago. Yes, it takes "The World's worst newpaper" that long to get stuff together. I am not going to type it in because it is to the usual standard of the LA Times - Long and turgid.

Here are a few highlights: It all started when Ronald Reagan heard a tape of Richard Burton. Yes, Ronald Reagan, the chief cause of what ails this world. Burton says he won't "talk dirty" unless provoked. He claims he has heart and lung problems. Last year he weighed 480 lbs! He faces further charges for transmitting without a licence earlier this year.

So there it is, sandwiched in with all the whiney stuff about about "Latinos Short Changed in Riot Aid", "Lost Faith in Police Residents Tell Panel Probing Riot Response", "Mothers Appeal to Other Parents to Help End Student Walkouts".

If you really want to read this stuff, I am sure your local library has it.

Since I have plans using a number of wide band antennas (discone/duo band GP/
log periodical yagi) I would like to be able to accomplish some sort of
cross connection between different antennas/rigs. (2m/70cm/23cm)

My idea was to do this in "Ye old telephone switchboard style"
(I also have a feeling that buying a whole bunch of coaxial switches doesn't
improve my financial situation ..... :-))

Is this a good idea ????

How would one design this magic "black box" ???

- What type of connectors should I use ??

- What about (RF) isolation ???

- loss ???

Any help on this subject would be greatly appreciated !!!!

2784. ORBITING FM REPEATER?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-17 08:48:52 UTC
From: s_eckart@lis.e-technik.tu-muenchen.de
Message-ID: <stefan.716719732@tumlis>
Source record: 285268

A recent discussion in this news group was about why the downlink of AMSAT OSCAR 21 / RS-14 is on 145.987 and not on a regular FM channel. The explanations given are correct, maybe some additions:

Main purpose of the RUDAK II experiment (which is a German acronym for regenerative transponder for digital amateur radio communication) is to be a technology testbed for the forthcoming Phase 3D project (successor of AO 13). It has four digital data receivers (3 for PSK, one for FSK), the FSK receiver can also be used for analog purposes. The downlink is capable of PSK, RSM (rectangular spectrum modulation), FSK and FM. The downlink frequency was originally chosen to be 145.990 MHz, between the upper end of the analog transponder of RS-14 and the upper end of the satellite band. In order to reduce the risk of having significant spectral components outside the band (above 146 MHz) when using 9.6 kbit/s modulation, the center frequency was shifted a bit lower. On the other hand, the actual transmission frequency can be shifted by software over a +/- 6 kHz window. In FM mode the received center frequency does not only depend on the downlink Doppler but also on the uplink Doppler and the uplink frequency, since the software presently doesn't remove DC content from the decoded uplink signal. So the best you can do is to try which channel you get the signal best and use it. The modulation index of the downlink is not very high, thus it's not too critical. If you want to hear the signals you should use any satellite tracking program in conjunction with the orbital elements of AO-21. It can be heard several times per day. According to the present schedule the downlink is also used for digitized speech and PSK telemetry.

By the way, the experiment is more than merely an orbiting FM repeater. Due to a problem with one of the on board computers we have to rewrite a bit of software but hope to be able to use RUDAK II for digital experiments soon.

Bye,

Stefan, DL2MDL, AMSAT-DL RUDAK GROUP

Well, that range is impossible via Ground Waves..... Ground waves are
typically line-of-sight, due to the curve of the earth. BUT, "skip", the
bouncing of signals off the earth and the atmosphere can get a signal to
travel around the world.... IF the band conditions are correct.

|> >equipment.
|> *----
|> What does this have to do with checks?
```

Yea, we all know how up to date the Callbook is. So that guy whose license came in the mail on thursday who came to the hamfest to get his first radio shouldn't be allowed to have it until his name makes it into the Callbook. And of course, you can't trust a newbie like that not to bounce a check!!

If you think this sounds kind of vitriolic, look up DA1WO in the DX Callbook. Last time I looked (last year) it still listed me. That license expired over 10 years ago. Yea, the Callbook is a real authority.

```

|> Now I'M paranoid. If you want to see my credit card when
|> I pay by check, then YOU'RE probably trying to pull a scam
|> (like phantom charges on my account). You don't want to trust
|> the customer, but you expect him to trust YOU?
```

I believe if you check, you will find that this has been made illegal. I know it is in this state and a number of others, and I remember seeing something recently about federal legislation to make it uniform in all the states.

I can assure you, we will never do business together. I believe in the golden rule: "He who has the gold, makes the rules." There is nothing you could ever offer that could not be bought somewhere else. If you are going to treat me like dirt, I will take my money elsewhere. I sure hope you don't make your living in retail sales.

Ferrite, ferrite, and more ferrite! I have a TS-850 and have brought down
the computer generated noise level from S5 to just under S1 buy doing the
following:

Put split core ferrites on all power cords.
There should already be one on the monitor video cable.
Put ferrites on cables to the mouse and keyboard.
Put ferrites on the phone lines from your internal modem.
Rebuild all RS-232 cable placing ferrite bead on all leads
and add copper braid (from RG-8) over the outside of the
cable, grounding it at both ends.
Put flat ferrites inside computer on the cables to the disk drives.

Basically the idea is to keep all the RF inside the computer's metal case. You
cannot eliminate it, just control it. My computer was unusually difficult
because it has a plastic front. I need to get either a conductive spray paint
or aluminum foil and conductive tape on that part. On the TS-850, it is
especially important that the cable used to connect the rig to a TNC is well
shielded and RF suppressed (just like the RS-232 cables mentioned above). I
generally use a combination of type 43 and 77 ferrites.

Best of Luck,

2792. Major reorganization of rec.radio.amateur.misc

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-17 12:53:56 UTC
From: zawodny@arbd0.larc.nasa.gov
Message-ID: <Buq3tx.8xv@news.larc.nasa.gov>
Source record: 285273

I've been reading this news group for well over a year now and is has grown to
a considerable size. The number of responses is nearly 100 per day now and
varies over a wide range of topics. I wonder if it might not be beneficial to
all if this group were subdivided into more focused catagories rather than
being all lumped into one .misc group. My recommendation is for the following
subdivisions to replace the .misc group:

.technical - This group would be for the discussion of real
tube/transistor and coil kind of stuff. Projects,
antennae, RFI, propogation and such might be examples
of relavent topics.

.consumer - This group is for the "What do you think of ...'s rig" or
"Where can I find a manual for a ..." or "Has anyone had
problems mounting a ... in a ..."

.bulletin - Here is where all the automatically forewarded ARRL stuff,
DX reports, Solar info, and Special event/contest messages
would go.

.ragchew - This will be the largest of the news groups and one I will
not read ;-) . Here is where you put all your frustrations,
BS, and ham related tidbits that really are not appropriate
to any of the other boards.

Now if we could only get some sense of order in the world of packet!

Thank you for the soap box,

-

2796. Worldband frequency question/looking to buy a radio

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-17 14:05:28 UTC
From: f3w@mentor.cc.purdue.edu
Message-ID: <Buq754.3qI@mentor.cc.purdue.edu>
Source record: 285178

I have a few questions. I hope I'm posting them on the right group; I apologize for wasting bandwidth if I'm posting on the wrong group.

I'm looking into buying a radio that will let me listen to more than standard AM/FM...things like short wave, etc. There are a LOT of options out there, however, so I'm a little confused.

I saw one radio I liked for about $179 that covers LW, AM, and SW (150 kHz to 29.9 mHz) and FM.

My question is this: what exactly is available on these bands? And what am I missing by not being able to get the 30 mHz to 88 mHz range, and the range above standard FM (I saw one radio, for $1300 (!) that could handle every-thing up to 2000 mHz--what kind of broadcasts do you get on those freqs?)

If anyone has a simple list of the various bands and their frequency ranges, I would be grateful for a copy.

Thanks in advance.

Mark Gellis

It is, just possible that Ham was arrived at by two different avenues at the
at nearly the same time. This has happened many times thoughout history in
other areas.

2799. Re: Best way to leard Morse code?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-17 14:59:28 UTC
From: cole@concert.net
Message-ID: <1992Sep17.145928.3626@rock.concert.net>
Source record: 285180

Greetings!

I'm sure everyone has their way of learning code, but I'm so pleased with my passing I want everyone to know how I did it! It didn't seem to be such as big a deal to me once I decided I was going to do it, not try it (spending several hundred dollars on a radio was also an incentive...)

The end of July I bought a HF radio. Being a Technician at the time, I wanted to operate with General privileges. So, armed with the Radio Shack tapes, SuperMorse, and W1AW I set out to attain 13wpm.

I used the tapes to control the rate, and used SuperMorse to reinforce and practice. Both the Slow and the Fast Code Practice sessions on W1AW were a big help as well.

Some things I gathered along the way (most/all are plain common sense):

a) Don't get frustrated (courtesy of the XYL!)

b) I found it was better (at least for me) to practice for 10-30 minutes at a time several times a day/evening than trying to do it all at once. Take a break when the tape says to (that is, if you use the tape!) When you get tired or frustrated, stop for a while.

c) Keep copying. If you miss a letter KEEP COPYING, don't stop to think about it KEEP COPYING. Chances are you'll be able to fill it in later KEEP COPYING.

d) Don't think, just copy. Chances are your initial (instinctive?) reaction is correct. By the time you've thought about a character, another one has been sent.

e) Don't read while copying. This was one of my hardest habits to break. I could tell a difference when I broke it, though.

f) When you feel you've reached a certain speed, practice for a while at a couple wpm higher, gradually dropping the rate back.

g) Even if W1AW is sending 35 wpm, try to copy as much as you can.

h) I read somewhere that by setting the character speed very high, you should be able to learn how a character sounds, and not count the dits and dahs. This really didn't do anything for me. I feel I learned the character sounds from practice.

I practiced one to two hours a night, three to four days a week for two months, at which point I passed 20 wpm (something I didn't expect!)

Good luck! Hope you can use some of these tidbits.

73 de KC4WEJ (/AG for now!),
Derrick

Message-ID: <oler.716743797@honte>
Source record: 285269
Cross-posted to: sci.astro,rec.radio.amateur.misc,rec.radio.shortwave

/\

MINOR GEOMAGNETIC STORM ALERT

ISSUED: 15:00 UT, 17 SEPTEMBER

/\

ATTENTION:

Geomagnetic activity unexpectedly increased from mostly quiet levels to minor and occasionally severe storm levels over the last 12 hours. Major to severe geomagnetic storming has been observed during the last six hours over the middle latitude regions. High latitudes have observed periods of severe geomagnetic storming over the last twelve hours. A clear source for this activity has not been determined, but recurrent patterns over the last solar rotation showed a similar (but somewhat less intense) enhancement in activity on 20 August which coincides nicely with a recurrent coronal stream.

Geomagnetic activity is expected to be at active to minor storm levels for most of the remainder of 17 August, becoming mostly unsettled to active on 18 August. Periods of storm activity could continue for the next 6 to 18 hours.

There is a chance activity could briefly reach the major storm threshold before the end of this UT day.

** End of Alert **

2803. AURORA WATCH: Middle Latitude Auroral Activity WATCH

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-17 15:37:41 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.716744261@honte>
Source record: 285270
Cross-posted to: sci.astro,sci.geo.meteorology,rec.radio.amateur.misc,rec.radio.shortwave

/\

MIDDLE LATITUDE AURORAL ACTIVITY WATCH

ISSUED: 15:15 UT, 17 SEPTEMBER

/\

VALID UNTIL: 19:00 UTC ON 18 SEPTEMBER

MODERATE RISK PERIOD: 17 - 18 SEPTEMBER (UT days)

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: MODERATE

POTENTIAL LUNAR INTERFERENCE: MODERATE - HIGH

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: FAIR - POOR

AURORAL ACTIVITY MAY BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

WASHINGTON STATE TO IDAHO TO WYOMING TO SOUTH DAKOTA TO SOUTHERN
MINNESOTA TO WISCONSIN TO MICHIGAN TO PARTS OF NEW YORK STATE TO NEW
HAMPSHIRE.

SYNOPSIS...

An unexpected disturbance strongly enhanced levels of auroral activity
during the local evening and early morning hours of 16/17 September.
Strong equatorward expansion of the auroral oval was observed between
04:00 UT and 06:00 UT, with the equatorward boundary of the oval
measured near 57 to 58 degrees geomagnetic latitude during this time
interval near the midnight meridian. Unfortunately, the phase of the
moon strongly inhibited attempts to view activity.

Lunar phase will continue to inhibit attempts to view activity. For
this reason, a watch is being released as opposed to a warning.
Conditions may continue to be favorable for middle latitude sightings of
auroral activity (particularly north of the Canada/U.S. border) until
approximately 12:00 UT on 18 September. Some stabilization is
anticipated by this time.

This WATCH will remain active until 19:00 UT on 18 September when it
will either be updated or allowed to expire.

** End of Watch **

2804. Re: Worldband frequency question/looking to buy a radio

> to 29.9 mHz) and FM.
> My question is this: what exactly is available on these bands?

LW (Long Wave): some very limited broadcasting, navigation beacons.
Not very interesting.

AM (Amplitude Modulation): standard AM broadcasting

SW (Short Wave): international, "world band" broadcasting. Virtually every nation has at least one shortwave service, broadcasting news, culture, music, and their point of view. Much is in languages other than English, but most have at least one news broadcast each day in English. Listening to these broadcasts is very, very interesting, and is a well organzied hobby called Short Wave Listening (SWL). There are books, magazines, clubs, computer software, etc. A very good receiver can be had for $300 - $400; the one you mentioned for $179 is probably OK, but not great. An outdoor antenna will work lots and lots better than the little whip on the radio; a simple wire strung from your house to a tree (and protected by a lightning arrestor!) will work fine. There is also a lot of ham radio activity in this frequency range, although you'll need a radio with LSB, USB, and CW modes (lower sideband, upper sideband, and continuous wave) to hear it; not all receivers have these modes.

30-300 MHz: ham frequencies (principally narrow band FM), public service (police, fire, rescue), air traffic control (AM), etc. Lots of folks find this interesting to listen to; scanner receivers that let you program in a few hundred frequencies of interest and then scan them in sequence sell for $300 or so.

300 MHz and up: more public service and ham, cellular phones (although you're not supposed to listen to them), etc. Unless you like to evesdrop on people's phone conversations, there's not much here.

You're best bet is a good AM/FM/Short Wave receiver. The shortwave broadcasts are very interesting, and you can get all sorts of info and software to help you find the stations that you want to hear. My advice is to skip the $179.95 job and go for one of the better receivers; you'll get good value for the extra money, and the better receiver will have more resale value if you ever want to upgrade. Call the Electronic Equipment Bank in Vienna VA (800-368-3270); they're one of the largest, if not *the* largest, shortwave dealers in the country. They also sell lots of books, etc, and they will send you a free catalog. Good luck and happy listening.

Mike, N4PDY

Rather than use relays (finding ones good to 23cm for less than astronomical amounts of money isn't easy), why not make up a patch panel, with N-type (here we go again!) bulkhead jacks for the radios and antennas and short patch cables to interconnect them in the desired configuration? I did a crude approximation of this in my last apartment, and when I start putting up real antennas this winter I'm planning to do the same thing. Yes it's kind of a hastle to change (compared to relays or switches) but it's far more flexible and doesn't have _that_ much loss compared to direct connections from the antennas to the radios. Besides, it's a great reference point for your ground system.

Willie Smith

2810. FM satellite downlink eavesdropping with pro-38

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-17 17:13:06 UTC
From: govax@wam.umd.edu
Message-ID: <1992Sep17.171306.28259@wam.umd.edu>
Source record: 285190

I have recently been given an old RS pro-38 scanner. This scanner
does receive signals in the 2m band. As I am starting to become very
interested in Ham satellite related activities, I thought it would
be interesting to see if I can "listen in" on any of those birds til
I get my license and can actually bother going out and getting equipment
to uplink to them. Problem is... I believe this scanner only receives
FM type signals (no SSB, USB, etc..) As FM downlinks don't seem very
common (drain on sat batteries I suppose) I was a bit surprised to
hear mention of a satellite that carries it. I believe this bird is
called AO-21. Well, for those of you who are practised in this area
I leave you these questions

Can I receive signals from something in LOE with just a rubber-ducky
type antenna? (I have a radio-shack centre-load whip antenna for 2m that
can be used) What recommendatios, if any, would you give to receive
signals with this equipment?
When does AO-21 transmit? (I havent heard it as of yet) Is there
a beacon frequency?
Are there any other beacons (FM) on satellites that I may be able to
hear with this equipment?

If it helps, I am familiar with traksat and similar tracking programmes,
so finding the satellite shouldn't be too hard. I am very new to the
entire scanning/dx-ing/ham area though, so any experiences you can share
would be greatly appreciated.

Thanx in advance,

Andy

2812. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-17 18:28:06 UTC
From: tkelso@afit.af.mil
Message-ID: <1992Sep17.182806.985@afit.af.mil>
Source record: 285196

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

Welcome back Everyone !!!!

Sorry for the delay, but I have been really busy these last couple of
weeks, and no one has been able to get in touch with me. But, we're back, and
we're getting everything together.

The club's first meeting of the year will be held on Wednesday, September 23rd, at 8:00 pm
in The CoRE Building Lecture Hall on Busch Campus
at Rutgers University. Our topic for the evening will be Emergency Preparedness
and Amateur Radio. We will be discussing RACES, ARES, SkyWarn, and the way
Amateur Radio helped out in the recent disasters in Florida and Hawaii.

This meeting is open to anyone who is interested, whether you are
a licensed radio operator or not. We look forward to a fun meeting and a very
interesting year.

Many projects that we are planning to take on will also be discussed.
Please bring and ideas and lots of friends to the meeting.

We will be monitoring the local repeaters for those who are going to
come from long distances. Please contact apod@physics or thayes@physics if
there are any questions.

>for most microcomputers? I don't know of any operations that wouldn't improve
>with speed.

I suspect that DSP chips do not have complete instruction sets. They are like math co-processors, only faster. They are best at FFTs, correlations, and such.

You need a TMS320 development environment. At minimum, this would include an assembler and loader. And, of course, you would need a DSP board.

> price range.

You're mixing apples and kumquats. The 470 is a dual-band (2 meters and 70 cm), while the 415 is 2 meters only. Take a close look at the FT-411e. Similar in most respects to the 415, it is first class two meter ht with all the bells and whistles you could ever want, and can be had anywhere
for around $285 or so, brand new. Used, they fetch $200 or so, depending on accessories and condition. Good luck.

Icom makes a combined 2 meter HT & wide-band scanner, but
I forget the model number. Check the catalogs or hit some
of the 800- numbers in QST. Good luck.

2821. ALERT: Minor Geomagnetic Storm Upgraded to Major Category

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-17 22:42:15 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.716769735@honte>
Source record: 285185
Cross-posted to: sci.astro,rec.radio.amateur.misc,rec.radio.shortwave

/\

MAJOR GEOMAGNETIC STORM ALERT

UPGRADED: 22:00 UT, 17 SEPTEMBER

/\

ATTENTION:

The minor geomagnetic storm has been upgraded to a major category event
at 21:00 UT. Activity surpassed the major storm threshold and is continuing
at minor to major storm levels.

A sudden magnetic impulse was observed at 17:50 UTC and may contribute
to activity over the next 24 hours. The geomagnetic storm is expected to
continue for the next 12 to 24 hours. Minor to major storming is expected
during the local evening and early morning hours of 17/18 September.

HF radio propagation is expected to remain below normal throughout the
next 24 to 48 hours. Geomagnetic and auroral storming will produce very poor
propagation over the high and polar latitude signal paths, poor to fair
propagation over the middle latitudes, and good to fair propagation over the
low latitude paths.

VHF backscatter activity near 90 to 100 MHz have been observed over the
last 24 hours. Conditions may sporadically become favorable for VHF DX
propagation over the next 24 hours.

** End of Alert **

2822. AURORA WARNING: Middle Latitude Watch Upgraded

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-17 22:51:16 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.716770276@honte>
Source record: 285184
Cross-posted to: sci.astro,sci.geo.meteorology,rec.radio.amateur.misc,rec.radio.shortwave

/\

MIDDLE LATITUDE AURORAL ACTIVITY WARNING

ISSUED: 22:10 UT, 17 SEPTEMBER

/\

HIGH RISK PERIOD: 17 - 18 September (UT days)
MODERATE RISK PERIOD: 17 - 19 September

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: MODERATE

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: >45 North Latitude

POTENTIAL LUNAR INTERFERENCE: MODERATE - HIGH

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: FAIR

AURORAL ACTIVITY _MAY_ BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

WASHINGTON STATE AND POSSIBLY PARTS OF OREGON TO IDAHO TO WYOMING TO
NORTHERN NEBRASKA TO IOWA TO NORTHERN ILLINOIS TO NORTHERN INDIANA TO
NORTHERN OHIO TO PENNSYLVANIA TO NEW JERSEY AND POSSIBLY DELAWARE
UNDER DARK SKIES.

SYNOPSIS...

Auroral storm activity is continuing in progress, but in a slightly
weakened state. An interplanetary disturbance arrived at 17:50 UT and
may contribute to elevated levels of auroral activity over the next 24
hours.

The phase of the moon is not particularly favorable for permitting views
of auroral activity. However, early-evening observations prior to
moonrise may be possible. Periods of strong activity will be possible
over the northerly middle latitudes that may be viewed over much of the
northern tier of the U.S. states.

This warning will remain active until 19:00 UT on 19 September when it
will either be updated or allowed to expire.

** End of Warning **

ADMINISTRATIVE BULLETIN

31 July, 1992

New Service Implemented for Internet Users

/\

NEW SERVICE IMPLEMENTED FOR INTERNET USERS

A new service has been implemented that can be easily accessed by those with Internet FINGER capabilities.

All of the major solar and geophysical indices can be obtained by typing: FINGER SOLAR@XI.ULETH.CA. After the fingered connection to xi.uleth.ca has been established, there will be a brief pause (up to approximately 30 seconds), followed by a list of all of the major indices.

Data presently available through this service includes:

- The most recent 10.7 cm solar radio flux value (updated daily and made available near 21:30 UTC).

- All Boulder and Planetary K-Indices (updated every three hours and made available at 0030, 0330, 0630, 0930, 1230, 1530, 1830, and 2130 UTC).

- Maximum magnetometer deviation for the last 3-hour period (updated every 3 hours).

- Running 24-hour Boulder and Planetary A-Indices (updated every 3 hours).

- Maximum, Minimum, and Average X-ray levels (1-8A band) observed over the last 3-hours.

- Maximum number of episodes of short wave fadeouts (SWFs) observed during the last 3-hour period.

- Estimated maximum duration of SWF activity observed over the last 3-hour interval (in minutes).

- Statistics and major indices for the last UT day, including: sunspot number, 90-day average solar flux value, Boulder and Planetary A-Indices, Boulder and Planetary K-Indices, Background X-Ray Flux, Proton Fluence at greater than 1 and 10 MeV, 72-hour

SESC and STD forecasts of the 10.7 cm solar radio flux, three-day Boulder and Planetary A-Index forecasts, and 48-hour K-index forecasts.

Additional information will be made available in the future, without prior notice. Incorporated data may include ionospheric data (foF2, TEC, etc), PCA data, etc.

** End of Bulletin **

2826. STS-47 Mission Extension

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-18 00:52:14 UTC
From: abfhb@stdvax.DNET.NASA.GOV
Message-ID: <9209181437.AA01610@east.gsfc.nasa.gov>
Source record: 285139

SB SAREX@AMSAT $STS-47-016
STS-47/SAREX Mission Extension

If you haven't heard by now, the STS-47 Spacelab-J mission has
been extended one day. The current plans are for the Space
Shuttle Endeavour to land at the Kennedy Space Center's Shuttle
Landing Facility at 7:19 a.m. EDT (11:19 UTC).

Dr. Jay Apt, N5WQL, has communicated to the members of JSC ARC
that he plans to operate SAREX in the voice mode for some of the
passes on the last day. The voice frequencies are:

Europe Rest of World
Downlink 145.55 145.55

Uplinks 144.80 144.95
144.70 144.97
144.75 144.91

The shuttle crew will not favor any of the three proposed uplinks
so your ability to work the crew will be the luck of the draw.

The SAREX team wishes you the best of luck in your efforts to
communicate with the crew on Endeavour.

2827. TVI dilemma

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-18 01:11:07 UTC
From: endelman@wellworld.Eng.Sun.COM
Message-ID: <Ibib5bINNjhh@exodus.Eng.Sun.COM>
Source record: 285215

I've been working to eliminate TVI in my own TV with only partial success, so I'd like to solicit ideas on how to proceed. I've done everything the standard ARRL books recommend, and I'm still having problems.

Please reply directly to me, as I don't get to read this newsgroup as often as I'd like to.

Transmitter: IC-751A (HF bands, 100W)
Feedline: RG-58
Transmitting antenna: 20M inverted vee, 20 feet above ground.
(I'm currently only on 20M.)

TV antenna: the usual commercial model, med. gain, about the same height as the transmitting antenna, at the opposite end of the house (about 50 feet away).
Feedline: 300 ohm twinlead, thru balun, to 75 ohm input on VCR.
TV: VCR piped into a color monitor. We also have an older tube-type console, which I get to use as an expermental control. (Symptoms are identical on both TV's, no matter what I do.)

Symptoms without filtering added: complete disruption of picture across entire VHF and UHF bands.

Suspecting front-end overload, I added the following:

1) Commercial high-pass filter. I tried both the Ameco 75 ohm filter and the Radio Shack one. Both work about the same: no interference above TV channel 5; a little on 5, more on 4, picture disruption still on 2. Still, much better than before.

2) Added a common-mode choke by wrapping a 3' 75-ohm cable around an FT-240-77 toroid, and adding it into the feedline between the balun and the high-pass filter. Surprisingly, no noticeable improvement. Also wrapped some of the twinlead thru a Radio Shack snap-on choke; no change.

3) Added a common-mode choke into the AC line of the VCR (by wrapping the line cord around another FT-240-77 toroid), and bypassed both sides of the AC line via .001uF/6kV disc capacitors to chassis ground. No change. I didn't expect one, since I previously terminated the antenna input with a 75-ohm terminator and didn't see any disruption of the "snow" during TVI tests.

4) To be on the safe side, added a commercial low-pass filter to my rig. Again, no change.

5) Finally, I drove a commercial 8' copper-covered ground rod into the earth outside my living room, ran a #12 wire to it, and tried touching

it to various ground points while the transmitter was going. I noticed perhaps a slight change, but not much.

My hypothesis is that the commercial high-pass filters just don't offer sufficient attenuation, given my situation, and that I should attempt to build one with deeper attenuation (~ 100-120 dB down at 30 MHz?).

[I tried hooking the two filters in series, but that doesn't improve things. I think I understand why: the TV signal is also attenuated by some amount by each filter as well, and the result is that the ratio of the two signals is still pretty close with two filters as with one.]

Moving the antennas is not really an option, nor is replacing the TV twinlead with coax. (The roof is too flakey to climb on, I don't own the house, and the feedline isn't implicated anyway, according to #2 above)

I tried looking at filter tables, but Chebyshev tables are usually good only out to about 10 poles, which won't suffice. Does anyone have access to more extensive tables, or to public-domain Unix programs that can calculate values for really deep filters?

In the meantime, I'll read the "Simplified Filter Design" book I bought and see what I can learn from it....

I'll repost a summary of interesting replies, and the ultimate solution, when I find one.

73's,

Aaron

2828. Packet uploading problem

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-18 01:31:01 UTC
From: segrest@bobseg.enet.dec.com
Message-ID: <1771@sousa.ltn.dec.com>
Source record: 285213

Greetings,

I recently brought up a MSYS BBS and some of my users have been experiencing problems when uploading. Interactive traffic and short messages like the menu or message of the day are not a problem. But for some reason the they loosing packets when uploading text files.

Does anyone have any ideas?

One of the users indicated that I might be overdriving my transmitter. I am using a KPC-2400 with an old Wilson-800 2M rig. The Wilson rig had a Turner hand mike. How can I check this?

2829. opinions on yaesu FT-290R MkII wanted

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-18 01:47:48 UTC
From: esj@harvee.billerica.ma.us
Message-ID: <H.YiASiem792Y@harvee.billerica.ma.us>
Source record: 285212

I've been living with a 2at for the past 6+ years as my only exposure
to VHF and I would like to expand my horizons a bit into 2m ssb.

I am thinking of getting the Yaesu FT-290R as advertised in the AES
flyer. I want to use the rig for public service (FM), day-to-day
mobile (FM), infrequent packet, and hill topping (ssb/fm). I would like
to be able to try satellites and aurora as well. I am looking at the
FT-290R because it fits my budget in terms of $$, weight, and size.

Is this a good general purpose mobile rig?
Is this a good beginners 2M ssb radio?
Am I expecting too much from this rig?
Any weaknesses or strong points I should know about?
Has it been reviewed anywhere?
Are there any hams around boston or southern NH that have this rig that would
let me come and try it out?
And last, are there any other light, portable 2m ssb/fm rigs for < 500$:-)

I hope to make my decision before sept 26 when the AES sale ends.

Thanks in advance for any and all opinions.

2830. Suggestions for first HT?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-18 01:57:00 UTC
From: Michael.Baumann@f60.n374.z1.fidonet.org
Message-ID: <716788825.AA00001@eilc.UUCP>
Source record: 285141

BLW>inexpensive 2m or 2m/70cm HT. I like the FT-470, but the FT-415 is more in
BLW>my price range. Can anyone give any advice on either of these

Between my brother (KA4ELS) and I (KD4RQV) we have both the FT-411E
and the FT-415. There are advantages to both, and both seem to share a
disadvantage. On the bad side, the inter-mod is BAD on both units. It does
seem (for whatever reason) to be worse on the 415 then the 411, but both have
the problem.
There is a definite difference in the way to two use the priority and
scan features. We both prefer the version in the 411 over the 415. The 415
has the jack for 12VDC internal to the unit (you need a special piece for the
411) however, the 415 warns to watch for over charging of the battery which
does not seem to be a problem with the system for the 411. Also, although the
jack is built in, it is an 'odd' size and the only place I have found to get
it is on the 'filter attachment' from Yaesu. So you wind up paying more for
the jack then is required. The factory docs say you do not need their
filtered cord, but the jack it's self does not seem redilly availible.
The external piece for 12V on the 411, makes the HT larger
(longer/taller, as you wish) but does not seem to hinder me. My brother on
the otherhand, dislikes the added length to the radio. The larger problem I
have found with the 12V adapter for the 411 is that it is wired with the ring
as positive. Any time the cord falls against any metal in my car, so much for
the fuse.
If you desire additional, please email specifics.

Mike...

My friend recently got his lisence and is eager to get some new HF equipment.

Could someone suggest a good HF transceiver for him? He wouldnt want something
very expensive or high-end. He is looking for something average in the price andbig in
performance.

Thanks in advance for the information.

P.S: Please reply in email.

>about that.

The FT-736 measurements were made at 20 kHz spacing, so this could be misleading. However, the difference, 36 dB, is about the attenuation you could reasonably expect from a single tuned cavity filter from say, 320 to 500 MHz (very rough, depends on how you couple and the bandwidth used). So, a 790 might be pretty close in blocking to a 736 with a single cavity in front of it for wideband RF signals. (74.5 vs 111 dB Blocking DR).

>Of course building the filter *into* the preamp as it's input matching
>network is ideal. What I was thinking of was using traditional "cans"
>in front of a 50 ohm input commercial preamp. That doesn't work very
>well. Insertion loss for a good tight "can" filter can exceed 3 db.
>That seriously degrades the system noise figure.

So obviously you shouldn't. The art of electronics is making the best use of available resources. This involves making decisions that, unfortunately for cookbook or the paint by numbers crowd, are rarely obtained by following a rote set of rules.

An area of uncertainty is how best do the input coupling. My current procedure is to use a tapped line on VHF and probe coupling on UHF, though I suspect that loop coupling may have lower loss than a tapped line. However, I don't know how to write useful equations or even do computer simulations of loop coupling. (couple the FET to the cavity)

>I've been using commercial preamps instead of rolling my own. Perhaps
>you could point me to an article describing a cavity input, low noise,
>high intercept, *stable* design for satellite use. I'm currently using
>commercial preamps at 145 and 435. And right now don't have any working
>preamps for 1269 or 2304.

A .15 dB NF 26 dB gain 2 meter preamp design was published in the 1991 Central States VHF society conference proceedings. Currently, the ARRL Lab doesn't have calibrated test equipment to measure whether a preamp is unconditionally stable (would love to have a 8510 network analyzer to make this measurement).

I don't know why you need a 1269 preamp, since there are no satellites using this as an downlink--just uplinks.

2840. Re: How do you count Germany for DXCC?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-18 09:52:44 UTC
From: WKOEHLER@ESOC.BITNET
Message-ID: <92262.095244WKOEHLER@ESOC.BITNET>
Source record: 285135

For the DXCC award, you can get credit for working Germany only ONCE.

Legal amateur radio operations in West Germany (DL) started in 1949, in East Germany (then DM) in 1953. For DXCC credit, it was counted as ONE country.

In 1973, both parts of Germany became members of the United Nations Organization. In recognition of this fact, they were now considered as two separate DXCC countries.

In the late 70's, the East German authorities (to be precise: the leadership of the East German commos) wanted to make the separation between the two parts complete in every aspect. That's why they handed back the allocated callsign block DMA - DTA to the ITU and asked for a new allocation. We know the results: Y2A - Y9A.

BTW, a change of allocated callsigns does not only affect amateur radio, but all commercial callsigns as well. Interestingly enough, all air planes of the East German Interflug that used to show their callsigns like DM-ABC on the outside, from now on did not, as you might have expected, read e.g. Y2-ABC, but sported calls like DDR-ABC. For those uninitiated, DDR stood for Deutsche Demokratische Republik (German Democratic Republic). I don't know what they used in actual traffic, though. Others, like coastal and ship stations, used their Y-callsigns.

So as of January 1980 all DM calls were changed to Y2, Y3 etc. calls.

Part of the callsign block given back by East Germany was acquired by West Germany, namely DMA - DRZ, which has now DAA - DRZ. The ITU allocated the remaining part (DSA - DTZ) to South Korea.

With the reunification on October 3rd, 1990, East Germany ceased to exist as a separate country.

DXCC-wise, East Germany is a deleted country that counted only from 1973 to 1990. Contacts with East Germany can be credited for DXCC as one country together with West Germany for the periods 1953 to 1973 and from October 3rd, 1990 onwards.

Old Y2, Y3 etc. calls are still in use till the end of the current year. From 1993 on, this callsign block is not valid for Germany anymore and has been passed back to the ITU. By then, all amateurs in the Eastern part of Germany will be issued new callsigns with the Prefix DL. To my knowledge, reviving the old DM prefix is not planned at this time.

Hope this helps to clarify the matter.

Source record: 285080

Follow Up On Hamfest Bogus Check

The bogus check passer has struck again at the Shelbyville NC Hamfest on the 6th of September. This was reported by a Charollte NC man who was given a bogus check for the purchase of his computer equipment.

The individual passing the bogus checks uses the name Terry C. Moore and gives an address of: 2712 55th Terrace South, St. Petersburg, FL 33712. He is a white male, height: 5'10" to 6'0", weight: 220 to 250 lbs, hair: Dark brown, medimum complextion with a full beard and speaks with a slow slurred southern accent. He uses an expired FL operators license, number: M600-803-57-269, for identification. The checks are drawn on an ** CLOSED ACCOUNT ** with the Southeast Bank, N.A. (Now owned by First Union Bank). When presenting the check, he is very calm and collected, giving one a false sense of security by his "good oleboy" demeanor. He is accompied by two other men both white males of aboutthe same age and build. At the Cincinnati Hamfest they were seen leaving ina Chevy S-10 Pick-up truck red with a white stripe bearing a TN vehicle registration.

Based upon my current information, he seems to be working the region between OH and NC in search of computer equipment. Anyone with information regarding Mr. Moore whereabouts or activities may contact St. Petersburg Police Dept. forgery unit Detective Chris Woodbury at 813-892-5411 or myself.

>away in my brain.
>Thanks for any good thoughts on this topic.

One of the difficulties is that the architecture of the processor is totally
different from the Von Neumann - architecture wich is still the basis of the
microprocessors in PC's and embedded applications.
The STAR-chips are more or less DATA-FLOW-processores.
To develop software for the DSP-chips available you need a SW-development
system on a powerful PC and interconnection hardware to the test board the
processor is on, so ..... this cost you a fortune .....

So far the DSP-technology is now the highest (analog) frequency that can be
managed is about 250 kHz so you could replace lf-parts and the last mf-part
in your receiver but there are penalties on dynamic range ....

>to 29.9 mHz) and FM.

>My question is this: what exactly is available on these bands? And what am
>I missing by not being able to get the 30 mHz to 88 mHz range, and the range
>above standard FM (I saw one radio, for $1300 (!) that could handle every-
>thing up to 2000 mHz--what kind of broadcasts do you get on those freqs?)

Over 30 MHz you miss some VHF HAM-bands, wireless telephone of your neihbour,
police, mariphone and that kind of stuff.
Over, let us say, 23 MHz is no broadcasting of any importance (except FM) so
buy the thing of $179 or a Philips D2932.

>By comparison, the TS-790 measured 111 and 81 dB. As I stated, these two
>numbers don't seem to be that important, based on postings by both Gary
>and Bob.

Those numbers may be deceptive depending on how far out of band the
blocking signal was that was used to derive them. The problem that
I was addressing was strong signals at least 10 MHz away from the
desired signal. You might comment on the measurements you quoted
about that.

>Actually, you certainly can put a very selective filter in front of
>a very low noise preamp and not lose much sensitivity. The high impedance
>that GaAs FETs like to see at VHF/UHF for low noise figure is intelligently
>accomplished by lightly coupling into a very high Q tuned circuit, such

>2 meters with good selectivity. And, if you really have a bad situation with
>FM broadcast stations on 2 meters, undercoupling the input circuit often
>yields the best system performance.

Of course building the filter *into* the preamp as it's input matching
network is ideal. What I was thinking of was using traditional "cans"
in front of a 50 ohm input commercial preamp. That doesn't work very
well. Insertion loss for a good tight "can" filter can exceed 3 db.
That seriously degrades the system noise figure.

>I don't understand why the filter placed after the preamp degrades the
>sensitivity. Modern GaAs FETs and PHEMTs have so much gain that the problem
>is usually getting rid of it. The hottest VHF preamps, using expensive
>power GaAs FET devices, are usually biased with a lot of current (30 to
>100 mA), so dynamic range is rarely a problem. Of course, using a $50 device

>don't seem to realize that devices such as the MGF 1302 can be used to make
>10 dB gain single stage amps at 10 GHz--it helps to make sure your design
>makes sense from DC to 20+ GHz . Its surprisngly easy to design microwave
>oscillators unintentionally.

Your last sentence says it all! *Good* preamps and commercially available preamps seem to be somewhat mutually exclusive. Hanging a high insertion loss filter on the output of a "tamed" low gain preamp increases the system S/N. Hanging a sharp filter on the output of a "hot" preamp makes a dandy oscillator. Doing it all *right* is challenging. For a modular system, liberal use of circulators will solve many problems. Of course finding good *cheap* circulators for the satellite downlink bands is not trivial.

I've been using commercial preamps instead of rolling my own. Perhaps you could point me to an article describing a cavity input, low noise, high intercept, *stable* design for satellite use. I'm currently using commercial preamps at 145 and 435. And right now don't have any working preamps for 1269 or 2304.

NEWS RELEASE #5

CONTACT!

WAKE STUDENTS TALK TO SHUTTLE ENDEAVOUR!

RALEIGH, NC. 9/17/92. Dissapointment turned to elation as four Wake County students finally made their delayed ham radio contact with the Space Shuttle. At 9:43 this morning, the voice of Shuttle Pilot and North Carolina native Curtis Brown crackled through the static in response to calls from ham operator Rob Oates, KM4OH. Rob handed the microphone to Cary High School senior Kevin Carter, who asked how ham radio had influenced Brown's career.

Pilot Brown's response was somewhat garbled in noise, as he answered that he did not have a ham license. The question was intended for Astronaut Jay Apt, who does have a ham license, but was working the night shift.

The rest of Brown's reply was lost in noise, but when Nicole Ferrell, a seventh grader at East Wake Middle School, asked what the astronauts would do in the event of a medical emergency, Brown's voice boomed in loud and clear. He told Nicole that this particular flight carried a medical doctor on board, but if the emergency were really serious the shuttle would land.

Today's contact was the second attempt by the Raleigh Amateur Radio Society to link the students to the shuttle as part of NASA's SAREX program (Shuttle Amateur Radio EXperiment). Yesterday (Wednesday), stations were set up at four area schools, linked through a UHF radio system to an "Earth Station" in North Raleigh. Although the shuttle's signal was strong here, the astronauts could not hear the ham's signals from the ground until just before the craft sped out of range. No questions or answers were successfully exchanged.

For the second attempt, the students talked directly to the shuttle from the "Earth Station" -- actually the home of Carl Ebhardt, W4HJZ. The contact was expected to last only about four minutes, since the shuttle's

ham antenna was not in the best position to receive signals from Earth, but solid communications actually lasted more than eight minutes. Kevin, Nicole, Effie Green Third Grader Chris Winstead, and West Millbrook Seventh Grader Nichole Scaraglino each asked their initial questions, then their backup questions, and then had to ad-lib additional questions to fill up the available time.

As Shuttle Pilot Brown delicately avoided the question about whether he was a State or UNC fan, the shuttle faded into the static again, beginning it's next 90 minute orbit around the planet. Amid hugs and tears, the students posed for pictures and answered questions for the assembled reporters in the cramped "ham shack." The two most frequent answers: "Nervous," and "Excited."

The SAREX program is designed to interest students in space and science by bringing it right into their schools, and also to demonstrate Amateur Radio's ability to provide backup communications under emergency conditions. More than a dozen schools across the Triangle area were tuned in to today's contact.

For more information on Amateur Radio, contact any neighborhood Ham -- you'll recognize the big antennas on their houses, or call Gary Pearce of the Raleigh Amateur Radio Society, at 233-8306.

Message-ID: <199209181341.AA20676@tilde.csc.ti.com>
Source record: 285128

Now that the fun has died away on this thread, here's a serious question:
What has changed in auto batteries in recent years? Used to be you could
tell when it was time to start looking for a new one by the ever-slower
cranking speed. When the starter slowed to a slow growl, you knew it was
time for the change. Nowadays, you get little or no warning. Last time
I had a battery fail, the starter spun the engine just like always as I left
home for the store. When I got ready to leave the store....."click-click!"

Does anyone know if there's been a technological advance that causes something
in the battery plates to fall out and short at the bottom of the cell after
a predetermined time?

According to CNN on Field Day 1990 the term HAM Radio came from the radios
built in the 1908 area. There was a magazine called "Home Amateur Mechanic"
(sort of Popular Mechanics of today). In a series of articles they told
how to make a transmitter and receiver. The poeple who built and used those
radios call them HAM radios. I think that CNN may have found the true
meaning of HAM radio. This could, of course, be easily verified at the
Library of Congress.

In rec.radio.amateur.misc, martin@datacomm.ucc.okstate.edu (Martin McCormick) writes:
> A couple of things sort of bother me, though. If a DSP chip is just
>a really fast microprocessor with an input port for an A/D and an output
>port for a D/A converter, then why aren't DSP chips simply used as the CPU's
>for most microcomputers? I don't know of any operations that wouldn't improve
>with speed.

That's not *quite* what a DSP chip is. The architecture of a DSP chip
is optimized for DSP computations and, by corollary, is often not very
good at doing things (like indirection, stack management, etc.) that
common CISC microprocessors do well.
One of the primary optimizations of most DSP chips is in that they
do a "multiply accumulate" (multiplying two values and adding the
resulting product to an accumulator) very fast. If you look at the
figure in the sidebar on p 48 of September QST and treat each z^-1
block as one stage of a shift register, you can see that on each
input sample the DSP chip must multiply each output of the "register"
by some coefficient, then add up the results. It also has to
shift the data through the "register." The TMS320C10 used in the
project has an instruction that adds the result of the most recent
multiply to the accumulator, loads the multiplier input register
with the contents of a memory location and copies the data from
that location to the next higher location in memory (shifts it).
All this in one instruction, mind you. That instruction, plus the
fast multiply instruction available on the chip, makes for a very
quick inplementation of the FIR filter used in the project. (The
TMS320C25 second-generation chip actually has an instruction that
performs the multiply, accumulate and data movement in *one*
instruction.)

> I think that DSP is one of those areas where hams can really be at
>the cutting edge of technology. I also think that DSP would be a good way
>to exercise some of the trig and the little bit of calculous which is rusting
>away in my brain.

To do "cutting edge" DSP work is going to take a pretty good
understanding of discrete linear system analysis. Such an understanding
doesn't come easily, and I wouldn't recommend attempting it without a
solid, engineering-grade (or better) math background. But that's not to
say there isn't plenty of useful *applications* DSP work to be done by the
ham with a solid understanding of programming and of signals. That is to
say, even if you can't develop new algorithms for signal processing, you
can use existing algorithms and design tools to build DSP *systems*. The
analogy I like to use is the simple op-amp active filter. To thoroughly
understand the circuit requires analysis via nth-order differential

equations, but an inability to do that analysis never kept anyone from using the "cookbook" formulas to successfully design a filter of desired characteristics and use it in a circuit. I hope to show that the same is true of much of DSP at the DSP workshop ARRL is holding at the Computer Networking Conference in NJ in November.

Indeed, my Elmer's List has all of these, plus a few more. Most
of them can be dismissed as very plausible urban legends.

The best guess as to the origin of the word is mentioned in my Elmer's
list. Check it out, I'm sure you'll be surprised.

I could not possibly disagree more. I started with an 8 megahertz PC, an oscilloscope, and built the board and developed all the code for the AEA DSP1232 with this system. AEA rewarded me with a 20 Mhz 386 Dell with 90 Meg hard drive which is still my only computer. I wrote all development software at home with the exception of the assembler which AEA purchased. I have written a simple macro assembler to replace this since the one from Motorola costs so much. There is little choice there I think. It has a small audience and costs lots of man years to develop and maintain. The DSP56001 and TSM320C3X and C4X are all fairly complete processors but have a Harvard architecture. They are NOT coprocessors and can run stand alone but it seems a waste of their resources to do so except in targeted control applications, etc. I have never bought one of these companies development systems and never will so far as I am concerned.

All software development tools for FIR, IIR, adaptive filters I wrote myself or stole (source) from some book, and likewise the graphical displays to look at my designs. The oscilloscope is used to output intermediate signals for diagnosis of problems. This has always worked well for me and is cheap as these things go. My entire development system including oscillscope, cost less than a complete development system from TI, Motorola, etc.

Bob

Back in 1967 in high school I mentioned to my chemistry teacher that I was getting an amateur radio license. To which he knowingly replied that HAM comes from Home Audio Modulation.... He wasn't a ham.

I concur. I can remember *judging* the health of the battery when leaving the 2 meter radio on all night long would cause no problem. As the battery degraded, the starter would be sluggish, but functional.

Recent battery failures have been completely without warning. Everything seemed normal, but after a 15-20 minute stop -- DEAD. Not even a grunt. This has happened at least twice, in different vehicles, with different battery mfgs.

So battery wizards -- what the heck is going on. Please return the *warning* system to batteries :-)

2863. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-18 19:51:39 UTC
From: tkelso@afit.af.mil
Message-ID: <1992Sep18.195139.9042@afit.af.mil>
Source record: 285170

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

In article <randall.716509066@seashore> randall@informix.com (Randall Rhea) writes:

>There is something that everyone needs to understand about
>personal checks. They are, in fact, I.O.Us. That's right:
>it's the same thing as someone writing "IOU" on a blank
>sheet of paper. Personal checks are, when all is said and done, a
>promise from the individual that they are good for the amount
>on the check. If the check bounces, you have only one choice, and
>that is to get the money from the person who wrote the check. If
>the person refuses, or if you cannot contact him, then you are out of
>luck. PERIOD.

There is a system, at least here in Indiana called "Small Claims Court".
I have been through it a couple if times for people who refused to pay.
Its VERY effective and very simple to use. The problem with using it for
people writting checks is finding them. Its most effective when the
person is local (mine were). I don't know how it would work out of state or
if it is even valid out of state. Anyway, the way it works here, you
go to the courthouse and file. Costs you 30 bucks (then: about 5 years ago)
and you can have the sheriff deliver the summons. When the court date
arrives, you both plead your case to the judge. He'll decide if the person
has to pay. Obviously, if the person wrote you a check, they were originally
going to pay and are legally obligated to. If the judge rules against you,
you only lost a couple hours of time and 30 bucks. If the judge rule for
you, you get your money in full plus you have the option (which I took) to
tack the court costs onto the bill. The claims at that time were limited
to $1500. I would say it would be a waste of time for anything less than
$100.

>Sure, you can call the police and try to take
>someone to court, but this takes time and energy and rarely produces
>results. The banks do not care and offer no protection from fraudulent
>check writers. As a person who is accepting a personal check,
>you are on your own.

What? The banks do to offer protection from bad check writers! At least
for them. If you take the check and cash it, they will give you the money
and then when the check bounces, they will demand the money back! After all,
they claim, they are not responsible. (I would tend to agree with that)

-- MONTHLY REVIEW OF SOLAR GEOPHYSICAL ACTIVITY --

Summary for August 1992

Report compiled by the
Solar Terrestrial Dispatch

Data Provided In-Part Courtesy of the
Space Environment Services Center, NOAA
and the
NRC / Dominion Radio Astrophysical Observatory
Penticton, British Columbia, Canada

NOTE: THE S.T.D. WILL TAKE ON THE RESPONSIBILITY OF COMPILING THE MONTHLY SUMMARIES OF ACTIVITY WHICH WERE PREVIOUSLY HANDLED BY THE SESC, COMMENSURATE WITH FUNDING. THIS IS THE FIRST MONTHLY SUMMARY GENERATED BY THE S.T.D.. WE WOULD APPRECIATE ANY COMMENTS WHICH MIGHT ENHANCE THE USEFULNESS OF THE REPORTS. PLEASE SEND YOUR COMMENTS TO: COLER@SOLAR.STANFORD.EDU.

MONTHLY ACTIVITY SUMMARY FOR AUGUST 1992

We are now in month 72 of solar cycle 22. The number of energetic events in August were similar to those observed in July. There were 487 flares (optical and x-ray) observed during the month. This is up by 11 percent over July's figure of 440 events.

There were 12 energetic flares in August compared with 13 in July. However, there were no major flares in August. July saw three major events, one of which reached X-class levels. The largest flare of August was a class M4.8/1N flare from Region 7248 (S13,L=029) at 07:06 UT on 03 August. This event was not associated with any Type II or IV sweeps, but had a fairly significant long-decay x-ray signature. A second long-decay class M2.3/1N tenflare (130 sfu) was observed from this region three hours later at 10:12 UT.

The list of M-class flares and associated radio emissions observed during August follows:

Date	Begin	Max	End	Xray	Op	Region	Locn	2695 MHz	8800 MHz	15.4 GHz
02 Aug:	2246	2303	2326	M1.6	SF	7248	S11E64	46	94	
03 Aug:	0625	0706	0720	M4.8	1N	7248	S09E68	34	64	53
	1007	1012	1018	M2.3	1N	7248	S09E63	130	24	
11 Aug:	2222	2228	2246	M1.4		300	200			
12 Aug:	0229	0234	0237	M1.0	1N	7248	S13W51			

20 Aug: 0901 0921 1031 M2.9 1B 7260 N16W27 28 390 520
1425 1437 1458 M4.0 1B 7260 N15W29 63 140 70
1654 1730 1806 M1.9 1B 7260 N17W34 240 250 92
2030 2046 2120 M3.0 1B 7260 N16W33
21 Aug: 0013 0018 0032 M1.3 1B 7260 N18W34 26 140 140
1056 1110 1131 M1.0 1F 7260 N14W40
1153 1200 1225 M1.9 1N 7260 N16W43 140

The two regions responsible for these minor M-class flares (Regions 7248 and 7260) had the following characteristics during the month:

REGION 7248

Region 7260 produced 131 optical and x-ray flares. Region 7248 was responsible for 95 discrete events.

A weak proton enhancement at greater than 10 MeV began on 04 September and is believed to have originated from the class M4.8/1N flare and/or the M2.3/1N tenflare from Region 7248 on 03 August. Protons at greater than 10 MeV remained enhanced through 05 August before surging above the event threshold of 10 pfu at 11:45 UT. The maximum proton flux of 14 pfu was reached at 12:10 UT. Gradual decay was observed after 21:00 UT on 05 August. Protons fell below the event threshold at 16:50 UT on 06 August.

Concurrent with the proton enhancement was an increase in PCA. Absorption levels peaked at a 0.6 dB level at 16:45 UT. The enhanced PCA fell back to near background levels on 06 August.

The geomagnetic field was generally unsettled to active with a preliminary computed average A-index of about 16 during August. Sudden magnetic impulses of 9 nT, 17 nT, and 16 nT were observed at Boulder at 14:08 UT on 04 August, 00:24 UT on 05 August, and 04:27 UT on 06 August respectively. Preliminary planetary geomagnetic indices for the month of August follow:

PLANETARY

The most disturbed day was 23 August when major to severe storming was observed between 00:00 UT and 09:00 UT. Rapid stabilization followed thereafter, returning the field to a predominantly unsettled to active state by the end of 23 August. This disturbance was associated with a Forbush decrease that began at 01:00 UT on 23 August, reached a maximum of approximately 7 percent near 09:05 UT, and ended near 17:00 UT on 23 August. A strong auroral display was also evident with this activity. Sightings as far south as Pennsylvania, Ohio, northern Indiana, Iowa and South Dakota were received during the local evening and early morning hours of 22/23 August. Weak VHF backscatter was reported during the severe storm periods early in the UT day of 23 August. An Australian site also reported weak but consistent backscatter on 92.1 MHz between 04:50 UT and 05:05 UT.

Levels of activity and solar indices are still below normal for this period of the solar cycle. Activity is expected to continue at a relative plateau for the September and October 1992 time frame.

* = Preliminary estimates, Unmarked = Final Values.

The lowest smoothed sunspot number for Cycle 21, RI = 12.3, occurred in
September 1986. The sunspot maximum for this cycle (cycle 22) occurred in
July 1989, with a peak smoothed sunspot number (RI) of 158.1.

Note: Prior to June 1991, the 10.7 cm solar radio flux measurements
originated from the Algonquin Radio Observatory near Ottawa. From June 1991
onward, the flux has been (and will continue to be) measured from the
Dominion Radio Astrophysical Observatory at Penticton, British Columbia,
Canada.

DAILY VALUES OF SOLAR FLUX AT 2800 MHz (PENTICTON-DRAO) AT 2000 UT

Data Valid for August 1992

Data Courtesy of the National Research Council of Canada
Herzberg Institute of Astrophysics
Dominion Radio Astrophysical Observatory
Penticton, British Columbia

2866. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-18 20:34:26 UTC
From: tkelso@afit.af.mil
Message-ID: <1992Sep18.203426.9713@afit.af.mil>
Source record: 285171

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.misc. This week's elements are provided below.

2867. Re: Popular HF transceivers ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-18 20:35:58 UTC
From: parkin@electron.Eng.Sun.COM
Message-ID: <lbkfdeINN2gn@exodus.Eng.Sun.COM>
Source record: 285147

Here are some recent reviews in QST for mid to high priced
HF transceivers, similar ones are available for low to mid
priced units:

Yaesu FT-1000 - March 91
Icom IC-765 - Dec 90
Kenwood TS-850S - July 91
Ten-Tec OmniV - Nov 90
Yaseu FT-990 - Nov 91

2868. Ham radio used as back up comm to shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-18 20:44:34 UTC
From: rwb@alexander.VI.RI.CMU.EDU
Message-ID: <BusKAI.63H.2@cs.cmu.edu>
Source record: 285150

Nasa just announced at a news conference that when the TDRS system went down for 20 minutes this morning due to a computer failure at White Sands, a ham in Australia relayed the situation to the shuttle astronauts.

Is this the first time SAREX has been used as a communications backup?

2869. phone line voltages, etc

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-18 20:44:59 UTC
From: taylor@tix.timeplex.COM
Message-ID: <9209182044.AA05993@tix.timeplex.com>
Source record: 285158

The phone line on-hook voltage is a nominal -50 VDC (tip side of the pair is positive with respect to the ring side). The off hook voltage is about -5 to -15 VDC. This value is a function of loop current and is mainly controlled by the loop resistance (copper pair resistance) to the Central Office. According to the Bellcore Notes on the Intra-Lata Networks 1990, The minimum loop current in the former "Bell System " is about 23 ma. That means, anything less than that might not hold the line off hook and/or be enough to "draw" dial tone. The max. current on a #5ESS switch is about 50 ma. Therefore, any line powered equipment has to draw less than 23 ma. (+/-) on hook if you don't want to draw dial tone. Any off hook powering shouldn't go above the 50 ma limit.

The ringing on the line is about 100 vrms at 20 Hz and is superimposed on the -48VDC (ring side) with respect to the tip. The tip side of the line is at earth ground potential at the CO switch.

Remember, also that any "foreign" grounds or any other return paths from tip to ring to external equipment that may be attached to the line will cause the switch to place the line out of service. The #5ESS and others have maintenance routines that look for problems on the line. The idea is, any devices that are isolated loads that attach to tip and ring are probably O.K. as long as no current originates from any external powered sources.

The standard disclaimer is of course, ANY Devices that attached to the Public Network per part 68 have to FCC registered and pass UL 1478 to prevent harm to the network. So, take from there.

Seth T. KC2WE

2870. Ramsey FX-440 comments

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-18 20:55:58 UTC
From: JRA1854%TNTECH.BITNET@cunyvm.cuny.edu
Message-ID: <01GOXO7ESDTU96WDD7@TNTECH.BITNET>
Source record: 285159

> A group of us here are interested in purchasing the Ramsey FX 440
> 70cm radios. Does anyone out there in netland have any comments.

Yes!

I have one and have, so far, found the following:
1) The receiver suffers from spurious responses (on is right where the signal I want to receive is....).
2) The transmitter has relatively strong sidebands at multiples of 12.5 kHz (the PLL reference oscillator frequency).
3) There is a lot of undesirable coupling going on inside the radio. Although the circuit board has a ground plane over much of the surface, there is no shielding anywhere. I have observed coupling from near the VCO to the side of the case and then to the receiver front end. This is probably a major reason for the receiver spurs.
4) The leads leaving and entering the case are not bypassed until they enter the circuit board. For example, the power lead comes in the back of the case, runs to the power switch on the front panel, and then runs back to the rear corner of the case to connect to the PC board. Only at that point is there any bypassing. Hmmm...about 12" of wire...440 MHz...gee guys, what a nice antenna!
5) It does not work on 9600 bps packet without modifications. The receiver can be made to work by taking the output directly from the Motorola 3335(?) IC instead of the point that Ramsey labels the "discriminator output". The eye diagram is not perfect but appears reasonable. The transmitter I have not gotten to work, yet. I suspect that the PLL is filtering out the low frequency components of the signal but have not had time to finish working on it. (The loop filter is a real *pain* to analyze!)
6) I'm not sure about this one: the PLL may cause the radio to switch slowly from transmit to receive and visa-versa. Some preliminary tests seem to indicate this. Gotta get number 5 solved before this can be tested.

If anybody else is working on this radio, with or without packet, I would like to share ideas.

Hi, I'm looking to buy a dual-bander HT, and I need some comments on
Kenwood's newest dual bander, the TH-78A, compared with Icom IC-W2A.
Which on is the best (best bang for the buck) ?
Thanks

2873. Radios for sale

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-18 21:16:17 UTC
From: krakow@mcnc.org
Message-ID: <1992Sep18.211617.8330@mcnc.org>
Source record: 285148

I have two radios for sale and one to give away:

Radio Shack DX-302: $ 100 or best offer (you pay shipping)
Collins R-392/URR: $ 125 or best offer (you pay shipping)
Bendix Radio Compass AN/ARN-6: free (you pay shipping)

Tom Krakow
krakow@mcnc.org
919-942-2792 (evenings and weekends)

Details follow on these radios:

Radio Shack DX-302: $ 100 or best offer plus shipping
Vintage 1982
LED frequency display
100% solid state (of course)
Quartz-Synthesized
Triple Conversion
Tunes 10 KHz - 30 MHz
Sensitivity:
1 uV at 900 kHz
0.5 uV from 3.1 MHz - 30 MHz
Selectivity selection: -6 dB and - 60 dB
Modes: AM, USB, LSB, CW
Power: AC, or 8 "C" cells
Size: 6" X 15 X" X 10" HWD
Weight: 14 lbs.
Comment: the radio is in great condition. This
model shows frequency drift upon warmup but after
one hour it is stable to within 1 kHz.
Documentation: I will include the Owner's Manual which
includes a schematic (20 pages).
Reason for selling: I don't listen anymore.

Collins R-392/URR, $ 125 or best offer (you pay shipping)
Vintage 1954, this is a classic military receiver!
25 vacuum tubes
Triple conversion on lower 8 bands
Double conversion on all other bands
Mechanical digital frequency display
Built-in crystal calibrator
Tunes 500 kHz - 30 MHz
Sensitivity:
9 uV at 500 kHz
7 uV at 1 MHz
5 uV from 2 MHz-32 MHz

Selectivity selection: 8, 4, and 2 kHz
Modes: AM and CW
Power: 3 amps at 28 volts DC
Size: 6" X 15 X" X 10" HWD
Weight: 52 lbs.
Condition: the interior of the radio is in very-clean condition.
The exterior shows some wear, but hey, this is military surplus.
Comment: this radio is a classic! In its time it was
considered the finest that money could buy. Both the electrical
and the mechanical workmanship is superb.
I tried the radio last night and it worked fine. The 9.5 MHz-10 MHz
band was loaded with stations. This is a tube radio and it has some
drift after warmup, hence I can make no guarantees as to long term
functionality. Although you can use this gem for DXing, I would
also recommend it for those who really appreciate the workmanship.
Reason for selling: I need the room.
Documentation: I will include the Instruction Book which
includes detailed schematic information (170+ pages).
Other: I will include a 24 volt 4 amp power supply and
a few spare tubes.

Radio Compass AN/ARN-6: free (you pay shipping)
Vintage 1948, this radio was designed for airborne navigation.
15 vacuum tubes
Triple Conversion on all bands
Mechanical dial frequency display
Tunes 100 kHz - 1750 kHz in four bands
Sensitivity: can't find a spec. but it seems to be quite good.
Modes: AM and CW
Power: 4 amps at 28 volts DC
Size: 6" X 11 X" X 10" HWD
Weight: 40 lbs.
Condition: the interior of the radio is in clean condition.
The exterior shows some wear, but again, this is military surplus.
Comment: although this radio was designed for airborne direction
finding, it serves well as a LW and BCB receiver using a
line or loop antenna. The original loop antenna is not included.
I do include a homemade wiring harness and the original tuning harness.
I tried the radio last night and it is not in the best condition.
The MW stations are there but somewhat garbled. Probably needs some
new tubes, and a better set of headphones.
Reason for selling: I need the space.
Documentation: I will include the Handbook Operating Instructions.
This book is not very good, but it does include schematics (18 pages).
Supply: I have a dead 24 volt power supply that I will put in the box.

2874. Yaesu FT767GX - replacing battery backup

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-18 21:30:42 UTC
From: fschwab@polaris.cv.nrao.edu
Message-ID: <FSCHWAB.92Sep18163042@polaris.cv.nrao.edu>
Source record: 285151

I have a Yaesu FT767GX which has worked flawlessly, except that the battery that powers its memory while the main power is off is evidently getting weak. The manual says to send the unit to an authorized repair facility to get the battery replaced. It seems that it ought not, perhaps, be so difficult to do that myself. Can anyone tell me whether that's indeed the case, and whether the appropriate replacement battery is a standard one which is readily available?

Also, I probably ought to open the rig up and vacuum out the cat hairs (sometimes I catch my cat sitting on top!). If I start loosening screws and sliding the cover off, am I apt to start tearing anything loose? Would anyone happen to have a copy of a service manual and care to photocopy for me the pages that show how to get access to things?

Many thanks, and 73. - Fred Schwab (W4OZJ)

2877. FCC and LOCAL PHONE SERVICE ???

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-18 22:22:41 UTC
From: wright@morekypr.BITNET
Message-ID: <9209182222.AA07612@ucsd.edu>
Source record: 285162

I have a news paper article here in front of me that I want to share
with the rest of you for your opinion. In its entirety :

FCC opens local phone service to more companies.

The Federal Communications Commission moved yesterday, 9/17/92
to open the $90 billion local telephone exchange market to new
competition. FCC Chairman Alfred Sikes said the order, which
requires local exchange carriers such as the regional Bell Telephone
companies, is "a historic step." He said access to local markets was
"one of the few remaining monopoly reserves of the American telephone
business." Long-distance telephone service was opened to competition
by a 1982 federal court ruling. Communications experts said the plan i
alternative communication lines rather than home consumers.

end of article.

Well, does this mean that we may get a cheeper rate for long distance
calls inside our LATA? Let me explane that, My Mom and Dad and I all
live within the same area code <606>. It is long distance for us to call
each other and because we both live inside the same Telephone LATA, GTE
of the South handles the calls. <INTRA Calling Area>. Because of this
we are unable to use another long distance carrier. GTE has this LATA
all to themselves.

In another related item, I read that the FCC is allowing Long Distance
carriers to block out other carriers's access to make a call.

The company I work for purchased a new phone system VIA MCI.
It is all fiber optic and seems to work OK. The Company is getting
a kick back from MCI for having the system installed btw....
It was reported in the Company business paper that one of the folks
here attempted to use her AT&T calling card and it took almost an hour
for her to get an AT&T operator because MCI ordered a BLOCK of all
out going long distance calls from here except via them MCI.

Oh well. Until later

>etc.?

Usualy 150-174, I forget the UHF. 5W. I work in the communications Industry,
and I think they are * * J U N K * *. If they break pitch em. However,
if you are looking for an OK, reasonably cheep throw away radio, they
serve their function. Depending on the model, the frequency is fixed
ie, you tell your sales man what frequency you are licenced for, and your
PL (CTCSS) tone and he will have one made for you, or you can
order one of the fancy ones that is multi channel/programmable, and then
you have your rep program it. If you are looking at one of the 3 channel
pre programed (offensive description deleted) specials, you still need
a licence.

2879. The Truth about UHF Connectors

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-18 23:03:13 UTC
From: alanb@hpnmdla.sr.hp.com
Message-ID: <14570492@hpnmdla.sr.hp.com>
Source record: 285169

Ya gotta feel sorry for UHF connectors. Recent strings on this notes group lambasted them as worthless at VHF and above, and barely tolerable at HF. One poster called them "5 dB attenuators", and many agreed that there must be some sort of conspiracy among ham equipment manufacturers to inflict such garbage connectors on the amateur community.

Today I finally remembered to bring some UHF adapters from home so I could do some relative measurements of UHF versus type-N. As expected, the type-N showed lower insertion loss at high frequencies, but the UHF connectors were hardly "5 dB attenuators."

For the test I connected an HP8753 RF network analyzer through two short BNC cables into the following arrangement:

```
_______ ____________ ___________ ____________ _______
| | | BNC female | | N female- | | N male to | | |
__| 10 dB |__| to N male |__| N female |__| BNC female |__| 10 dB |__
| Atten.| | adapter | | adapter | | adapter | | Atten.|
|_______| |____________| |___________| |____________| |_______|
```

Then I repeated the measurement with the N adapters replaced with UHF. I normalized the measurements by replacing the 3 adapters with a BNC double-female. (That is, this was assumed to have 0 dB loss.)

Since two N or UHF adapters were used, I assume the loss per connector is half the total. The vertical scale was .1 dB/division, so I estimated the insertion loss to the nearest .01 dB or so:

--------- Type N ----------	---------- UHF ------------
FREQ (MHz) TOTAL LOSS PER CONNECTOR	TOTAL LOSS PER CONNECTOR
1.8 0 dB	0 dB 0 dB 0 dB
30 0	0 0 0
100 0	0 0 0
150 0	0 .02 .01
200 0	0 .03 .015
450 0	0 .18 .09
600 0	0 .26 .13
900 0	0 .66 .33
1000 .05	.025 .8 .4
1300 .1	.05 .86 .43
1600 .05	.025 .5 .25
2000 .05	.025 .02 .01

Insertion loss increases until about 1200 MHz, and then starts to decrease until it is almost zero for the UHF connector at 2 GHz! At this frequency, the connectors are about 1/4 wave long (1 inch,

assuming .66 velocity factor), so I assume that the two adapters are providing a conjugate match to each other. This confirms my assumption that the insertion loss is due to reflections (impedance mismatch), not absorption (true power loss).

Bottom line: UHF connectors work fine through the VHF range, and are not too bad even on the 420 MHz band if you can stand about .1 dB mismatch loss per connector.

By the way, I did not do the full 2-port calibration on the HP8753, so there is a couple hundredth's dB ripple in the plots. I averaged this out by eye to come up with the numbers in the above chart.

Another gripe I have with Ramsey is they have sold kits with missing parts that they have yet to supply. I have been calling them for a month about an IC, a divide-by 64/65 prescaler that is not second-sourced. Now I also found out that all the FX-440 kits are on backorder. Probably for this part if not more. So even if you manage to get one, you won't be able to find out it won't work at 9600, as advertised in their lit. I'm ready to send the partial kit back and let them fight the credit card company for their money :^(

Oh, yeah, the part will be in "next week"...

In article <lbfamqINN2j0@news.bbn.com> brosen@BBN.COM (Bruce L. Rosen) writes:
>I'd be interested in hearing suggestions and user experience with regards
>to using a PC clone in the ham shack.

as would I.... :-)

>The problems I've experienced are
>the obvious ones: 1) video noise getting into the receiver 2) if the
>two are actually physically connected (like when using AEAFAX), lots of
>computer noise getting into the receiver 3) occasional transmitted RF
>getting into the computer.

first off, a little info: computer is a 20 MHz 386, but everything
I'm going to describe was true when it was a 16 MHz 286, too (was just
a motherboard upgrade --- same cabinet).

the main problems I run into pretty much match the above, except in my
case it's when trying to run AMTOR on certain bands. I live in a
high-rise, so my situation is compounded by the fact that my antenna is
partially indoors (1/4 wave out window, and a 1/4 wave counterpoise
inside).

on 20m, I have no problems either way....so obviously, I tend to work
20m more often than not. :-)

on 30m, I get a mild bit of interference with the monitor (gets brighter),
but the noise from the computer trashes the receiver. in this case, the
noise from the computer is via the keyboard, and I've found that an old
keyboard of mine reduces this to tolerable levels (I setup an extension
of the keyboard plug on the computer, and can just switch keyboards).
problem here is, my old keyboard really stinks...so I don't tend to use
it much (besides, I haven't found much AMTOR on 30m yet).

on 40m, the computer doesn't seem to interfere with the rig, but the
opposite doesn't hold true. :-(when I key down on 40m (even low
power for tuning) it has, uhh, unpredictable results on the computer.
usually, it seems to leave the computer in a semi-workable state, but
after a short time, it locks up and dies. sometimes it just dies,
period. oh, the pc speaker sounds off while I'm keyed down. :-)

can't say what happens on 80m, since I haven't gotten anything to load
well that far down (after all, this is a studio apartment.....). for
17m and up, no real problems at all with the computer, but keying down
on 17m does tend to turn my stereo on and off. :-)

>What have people done to minimize these effects?

if you find out, please let me know. :-) so far, I've heard little
on what to do here...just horror stories about how common it seems to
be.

Perhaps you are looking in the wrong place for the 'culprit'. The battery is only one part of your indicator. The improvements could be in:

the electricals and mechanicals of the starter

or

the fuel/air mixing on the engine

or a combination of all three.

> waco@cbnewse.cb.att.com (john.l.broughton) writes:

Just a short note about the emergency comms in South Fla...

I have an aunt that lives in Old Cutler Ridge (a few miles north of Homestead.) We went to get her stuff and bringer her back to the Ft. Laud area on Saturday after the storm. As early as tuesday and Wednesday (day after the storm) there was _heavy_ H&W traffic on HF, with the RACES nets up as soon as the repeaters were back up. In fact, in response to the poster who said that RACES/ARES is un-needed, I heard an awful lot of WC4... calls. If you don't know what those are, don't ask.

Anyway, there was extensive traffic in 2m and 70cm by the time I got there. Most of the cels were still down (due to land-line probs), and a lot of the H&W was all on Amatuer. In the 14 hours I spent down there, I heard at least two dozen messages concerning "911" calls, emergency medical supply needs, etc. In my opinion, although the hams were not the "primary" comm method, we certainly took up __a lot__ of the slack. Before the military got there, hams were co-ordinating their own SAR teams and drop-off points for relief. At one point I even heard Red Cross traffic on 2m because the Red Cross 47 Mhz radios were not functioning.

On my way in, I called net control just to list myself as active on the net in case of emergency. Net control (located at the Dade County Emergency Operations Center) insisted that I stop by to get a pass/ID which would allow me past curfew checkpoints in any situation.

Seems to me as though in a time of extreme confusion, where no-one seemed to have a plan, and the exception was the rule, hams came shining through and showed that they are truly not a bunch of OF's that use outdated methods of communication. We are still a living part of emergency response, and there is no doubt in my mind that hams saved lives and made life at least a little easier for thousands.

73 de KD4IDN
Clayton

P.S. - WC calls are special RACES calls (not issued any more) that do not show in the FCC database. They are considered "administrative" calls. $.02. I learned that myself just the other day!

That's half the figures. But you never mention the other
half - what percentage of ALL checks meet the same criteria.
For example, you say that 75% of the checks have a number
below 500 - what percentage of ALL checks received have a
low number? Maybe these percentages, aside from intentional alterations
and forgeries, reflect perfectly the same features of all checks
received.

>the cutting edge of technology. I also think that DSP would be a good way
>to exercise some of the trig and the little bit of calculous which is rusting
>away in my brain. <<<< SEGMENTS SWAPPED FOR CLARITY >>>>

Actually the trig and calculus aren't much use. The actual math involved
is both complex (in theory) and simple (in implementation). A typical
useage would be an Infinite Impulse Response (IIR) filter as follows:

y(n) = 2 * [(alpha * x(n) - x(n-2)) + Gamma * y(n-1) - Beta * y(n-2)]

Where: Alpha, Beta, and Gamma are calculated coefficients based on the
sample frequency, center frequency, and filter Q

x(n), x(n-1), x(n-2) are the three most recent A/D samples

y(n) is the filter output. It's value indicates power/voltage level
for the selected frequency from the input.

All DSP operations (IIR, FIR, FFT, etc) use similar math.

> A couple of things sort of bother me, though. If a DSP chip is just
>a really fast microprocessor with an input port for an A/D and an output
>port for a D/A converter, then why aren't DSP chips simply used as the CPU's
>for most microcomputers? I don't know of any operations that wouldn't improve
>with speed.

As for speed, any microprocessor could implement the above math, but the
DSP has specific instructions and hardware to do so. You will note that
the equation is a Sum of Multiplied values. The Multiply And Accumulate
(MAC) instruction performs the multiplication of the value and coefficient,

adds the result to an accumulator, and sets up index registers to access the next set of data and coefficients, ALL IN ONE INSTRUCTION. The DSP also has additional instructions for data format conversion.

In a segment above you mentioned the 68hc11. It's big brother, the 68hc16 has the generic microprocessor instruction set like the 68hc11 with 16 bit registers, and DSP hardware (36 bit accumulator) and instrutions. It's a neat chip which is also relatively inexpensive.

ZCZC AS78
QST DE W1AW
SPACE BULLETIN 041 ARLS041
FROM ARRL HEADQUARTERS NEWINGTON, CT
SEPTEMBER 18, 1992
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

SB SPACE ARL ARLS041
ARLS041 SAREX TO THE RESCUE

AMATEUR RADIO BECAME A NEW STAR IN SPACE AT 3:00 A.M. FRIDAY WHEN A SMALL, BATTERY-POWERED HAM RADIO ABOARD THE SPACE SHUTTLE ENDEAVOR LINKED THE ASTRONAUTS WITH NASA MISSION CONTROL AFTER COMPUTERS HANDLING OFFICIAL COMMUNICATION FROM EARTH FAILED BRIEFLY.

THE HAM RADIO, A TINY TWO-METER TRANSCEIVER INSTALLED ON THE SHUTTLE AS PART OF THE SHUTTLE AMATEUR RADIO EXPERIMENT (SAREX) IS USED BY ASTRONAUTS TO TALK WITH SCHOOL CHILDREN AND LICENSED AMATEUR RADIO OPERATORS ON EARTH. SHUTTLE CREW MEMBERS JAY APT (AMATEUR RADIO CALL SIGN N5QWL) AND MAMORU MOHRI (7L2NJY) OPERATE THE RADIO DURING CONTACTS.

ORDINARILY, MISSION-RELATED COMMUNICATION CONTROLLED BY COMPUTERS IN WHITE SANDS, NEW MEXICO. THE COMPUTERS COORDINATE THE FLOW OF DATA BETWEEN MISSION CONTROL IN HOUSTON, TEXAS AND ORBITING COMMUNICATIONS SATELLITES AROUND THE GLOBE. THE SATELLITES, IN TURN, RELAY MESSAGES TO THE SHUTTLE, PROVIDING VIRTUALLY CONSTANT COMMUNICATION REGARDLESS OF THE SHUTTLE'S POSITION.

BUT A GLITCH IN THE WHITE SANDS COMPUTERS PLUNGED THE SHUTTLE INTO A TEMPORARY COMMUNICATION BLACKOUT. MISSION CONTROLLERS COULD HEAR PILOT JAY APT, BUT COULD NOT RESPOND TO HIM AS THE SHUTTLE ORBITED THE EARTH.

AT THE TIME OF THE OUTAGE, THE SHUTTLE WAS COMING OVER THE HORIZON TOWARD A SCHEDULED AMATEUR RADIO RENDEZVOUS WITH QUEENSLAND UNIVERSITY OF TECHNOLOGY IN BRISBANE, AUSTRALIA WHERE HAM OPERATOR ANDY JOYCE (VK4KIV) WAS STANDING BY FOR A SCHEDULED CONTACT. MISSION CONTROL IN HOUSTON ASKED LOU MCFADIN (W5DID) AND DOUG LOUGHMILLER (KO5I), HAM OPERATORS IN THE NEARBY SAREX CONTROL ROOM,

TO RELAY A MESSAGE TO APT VIA AUSTRALIA THAT COMMUNICATION SOON WOULD BE RESTORED.

''EVEN THOUGHT SAREX IS PRIMARILY AN EDUCATION PROGRAM, WE'VE ALWAYS RECOGNIZED THAT AMATEUR RADIO COULD BE A BACKUP LINK IN A NASA SPACE SHUTTLE MISSION,'' SAYS ROY NEAL (K6DUE), CHAIRMAN OF THE SAREX WORKING GROUP. ''THANKFULLY, THIS WAS ONLY A ROUTINE PROBLEM. EVEN SO, THE PERFORMANCE OF HAMS OPERATING SAREX LIVED UP TO OUR EXPECTATIONS, AND HELPED KEEP THE ASTRONAUTS POSTED. THIS KIND OF PEOPLE-TO-PEOPLE COMMUNICATION IS WHAT AMATEUR RADIO IS ALL ABOUT, WHETHER IT'S CONTACTING FRIENDS AND FAMILY AFTER A MAJOR HURRICANE HERE ON EARTH, OR RESOLVING A MINOR MALFUNCTION IN SPACE.''

MCFADIN SAYS THAT THE STUDENTS IN AUSTRALIA WERE SO STARTLED BY THE UNEXPECTED TURN OF EVENTS THAT THEY WERE UNABLE TO REMEMBER THE QUESTIONS THEY HAD PREPARED TO ASK APT AS THE SHUTTLE PASSED OVERHEAD. MCFADIN SAYS THE COMMUNICATION OUTAGE LASTED 20-25 MINUTES.

SAREX IS AN EDUCATION PROGRAM DEVELOPED JOINTLY BY THE AMERICAN RADIO RELAY LEAGUE (ARRL), THE RADIO AMATEUR SATELLITE CORPORATION (AMSAT) AND THE NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA).

SB SPACE ARL ARLS040
ARLS040 STS47 NUMBER 5

MISSION SPECIALIST JAY APT REPORTED THAT SO FAR ENDEAVOUR HAS MADE
CONTACT WITH ABOUT 5,700 HAM RADIO OPERATORS USING SAREX.

ALL SAREX VOICE OPERATION IS SPLIT, SHUTTLE DOWNLINK FREQUENCY IS
145.55 MHZ, TRANSMIT FREQUENCIES FOR ALL AREAS EXCEPT EUROPE IS
144.95, 144.97 AND 144.91. EUROPEANS SHOULD TRANSMIT ON 144.80,
144.75, AND 144.70. ON PACKET, THE UPLINK FREQUENCY IS 144.70.

QSL TO N5QWL, 806 SHOREWOOD DRIVE, SEABROOK, TEXAS 77586 USA, WITH
THE USUAL SASE OR EQUIVALENT. INCLUDE THE CALL SIGN WORKED, DATE,
UTC, MODE, AND FREQUENCY. FOR PACKET CONTACTS, INCLUDE THE QSO
NUMBER ISSUED BY THE ROBOT.

THESE DATA ARE FOR USE WITH SHUTTLE/OSCAR LOCATOR TRACKING SYSTEMS,
AND HAVE BEEN DERIVED FROM THE GSFC-014 KEPLERIAN ELSET.

STS47/SAREX EQUATOR CROSSING TIMES AND LONGITUDES FOLLOW.

SB DX ARL ARLD048
ARLD048 DX news

Thanks to Bob, WB2CJL, the Western New York DX Association and Garry, NI6T, for the following DX information.

KERMADEC. ZL4DO is on now with the call sign ZL8RS. He will be very busy with his work, so hamming will be limited during his one or two week stay. Watch 14216, 7087 and 3800 kHz and your local PacketCluster node for other spots.

GLORIOSO. Jack, FR5ZU/G, has been very active on RTTY, but there have been no reports of SSB or CW. Plans are to move on to Juan de Nova FR5/J, and operate there from September 21 through October 4. He will then be travelling to Europa, FR5/E, for October 5 through 15 activity. The correct QSL information is Jacques Quillet, PO Box 347, 1 Cite Metro, Chaudron, F-97494, Ste. Clotilde, Cedex, Reunion Island, via France.

NORTH KOREA. Maarti, OH2BH, reports that progress is being made on a possible P5 DXpedition, although no starting time or date has been set.

MONGOLIA. Ron, K7HDK, will be operating satellite from Mongolia September 17 through 29. He will be active on OSCARs 10 and 13. This is believed to be the first time a Mongolian amateur station will be operating through OSCARs. QSL via John, KL7GRF.

WILLIS ISLAND. Operators VK9NS, VK9NL and VK2BEX plan to spend a week here around October 7 through 14. Their Mellish Reef operation has been cancelled.

YEMEN. Europeans have been heard working 7O0ZZ and 7O1ZZ, purported to be operated by VE7ZZ. Yet according to VE7ZZ, he is not now nor

ever has been in Yemen.

BERMUDA. The Radio Society Bermuda will be holding its annual Fall operating event, the Old Timers and Whipper Snappers Field Day, on September 26 and 27. VP9SWS, Super Whipper Snapper, is scheduled to be active for the very first time during this period, pending licensing. Otherwise, the call sign used will be VP9MN. The Society station will be on 10, 15 and 20 meters only, with most activity on SSB. QSL VP9SWS and VP9MN via WB2YQH.

BAHAMAS. To celebrate the 500th anniversary of Christopher Columbus discovering the new world, the Bahama Amateur Radio Society, BARS, will be on through the month of October signing C6A500. BARS members will be signing their calls with the /500 suffix. Awards will be available.

BANGLADESH. Cards are now being received stateside for the Jim Smith S21ZA operation. Bob, S21ZD and aka G4APV, has his license but has yet to be heard on the east coast. He should be active again September 20, 21 and 22.

MOLDOVA. RO0Q will be active September 26 and 27 during the CQ WW RTTY contest. QSL via UO4OLW.

TORTUNGA ISLAND, IOTA NA-149. HH2PK, HH2JO and HH2Z will be active September 18, 19 and 20 using the special call sign 4V4H. This is an island just north of Haiti. Look for them on 80 thvough 10 meters with CW and SSB. QSL KA9RLJ.

SEPTEMBER CONTEST CALENDAR.

The Scandanavian Activity Contest CW weekend is the 19th and 20th. The SSB weekend of this contest is on the 26th and 27th. Exchanges for both events are signal report and QSO serial number.

The CQ World Wide RTTY Contest on the 26th and 27th. RST, State, CQ zone.

EASTERN KIRIBATI. A group of Northern California DXers will operate T32RA from Christmas Island, IOTA OC-024, September 23 though 28, including the CQ WW RTTY Contest. Outside of cont hours, they will operate 160 through 10 meters with SSB and CW. I□ok for T32RA by KN6J, T32CW by NI6T, T32GV by W6OTC, T32RS by N6OXR, T32WS by WU6A, T32SS by KE6FV and T32GG by KE6GG. QSL their home calls.

SOUTH SANDWICH. The first of the VP8SSI cards are beginning to show in the mails. Please exercise your patience a little longer, as the managers have about 40,000 cards to complete.
NNNN

Good Luck on DX de KB8NW/OBS

I am in position of starting to do some DSP work. One of the more
interesting and frustrating differences between conventional and DSP
programming is the fixed point math used in the lower cost DSP parts.
One has to be very careful about manually maintaing control of
where the software fixed point is and to manage or design
out overflow conditions. This has to be done with an eye towards
minimizing loss of precision and, of course, maintaining speed.
Some of the very first stuff I've written came out either overflowed
or saturated when I didn't consider bit growth, etc. This problem
is especially troublesome in algorithms that are multistage, eg DFT/FFT,
since you don't find out about saturation/overflow until long after
the damage is done.

Rick

SB DX @ ALLBBS $RTDX0918
RTTY DX Notes 18 September
RTTY DX Notes for week ending 18 September, 1992 (BID RTDX0918)

For a start, welcome home John (TG9VT). Keep well.

Secondly from W1AW we note, the following have received ARRL DXCC
approval.

5R8JD, previously rejected cards may now be resubmitted.
S92IJ for operations beginning 18th March 1992.
S21ZA operations from August 1992.
XU1NU 6/7/92 to 6/1/93, 14, 21 and 28 MHz only.
XU0NU 6/7/92 to 6/1/93, 14, 21 and 28 MHz only.
FE6BIQ/D2 23/6/92 to 23/7/92, 14, 21 and 28 MHz only.
C9RJJ operation commencing 20/7/92.
7Q7CE operation commencing 4/6/92.
ZA/KA6ZYF 13/6/92 to 13/7/92.
ZA/G3MHV 13/6/92 to 13/7/92.

Our information this week came from DJ3IW, I5FLN, NT3B, TG9VT, VK2EG,
W1AW, WB2CJL and W2JGR and the Twin-Cities DX Packet Cluster Network.
Thank you all for your information and assistance. We hope that you
worked all the good DX that you reported.

Notes Of Interest.

Jacques FR5ZU/G is expected to move to Juan De Nova FR5ZU/J from 21st September. He will be QRV there until 4th October, then he will gravitate to Europa FR5ZU/E where he will be active from 5th October until the 16th. All cards go to the above address.

VP8BFH has gone QRT for a trip to the U.K. where he will remain for about 6 or 7 weeks. He will be back.

Jose D2EL says that he will be leaving Luanda at the end of the month, so if you still want him you will have to hurry.

Mount Athos. Doc (JA3PFZ) has apparently received an invitation from Monk Apollo to operate RTTY on November 8 from Mount Athos. Mark the calender for that one.

The team that went to Navassa (KP1) anticipates going to Desecheo (KP5) from December 27th through January 4th 1993. QSL etc to N0TG.

GL DE DX1 (VK2SG)

WHAT????!!??? NASA doesn't have a backup to TDRS???? What insanity!!!
Any communications system that is MISSION ESSENTIAL has to have full
backup. Or have MBAs and yuppies taken over NASA to the point where
the bottom line is omnipotent even at the cost of accomplishing the mission?

Incredible. This is what you get when too many fingers get into the pie.
BRING BACK THE BOYS FROM THE APOLLO DAYS!!! Back then at least it worked.

PACSATS MOVE EMERGENCY TRAFFIC

HR AMSAT NEWS SERVICE BULLETIN 263.01 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 19, 1992 BID:$ANS-263.01
TO ALL RADIO AMATEURS BT

UO-22 & LO-19 Move Health & Welfare Traffic From Hawaii

KI6QE reports that UO-22 is playing a major role in moving message traffic from the hurricane devastated areas in Hawaii around the world. Working in conjunction with the HF packet bulletin board systems (BBS) around the world, the traffic is collected and sent to Honolulu via 15M packet and via UO-22. From Honolulu, the traffic then goes directly to the devastated areas via ham radio or by a Navy MARS station. KI6QE says that out of a 1000 pieces of traffic handled thus far, 20% has been delivered using UO-22's BBS.

Earlier this week, KI6QE noted that UO-22's BBS was shutdown during a very critical period. A quick phone call to Ron Broadbent (G3AAJ) at AMSAT-UK brought a quick response from the University of Surrey (UoS) ground controllers to get the BBS up-and-running again. In the mean time, LO-19 was used as a back-up. Despite the fact that it was the middle of the night in the UK, the UoS team got UO-22's BBS working again in one orbit.

KI6QE points out that PACSATs are a perfect resource for moving message traffic from areas devastated by natural disasters. He further states that UO-22 has performed a great humanitarian service to the victims of Hurricane Iniki.

[The AMSAT News Service (ANS) would like to thank KI6QE for the information which went into this bulletin.]

AO-21/RUDAK-2 STATUS REPORT

HR AMSAT NEWS SERVICE BULLETIN 263.02 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 19, 1992 BID:$ANS-263.02
TO ALL RADIO AMATEURS BT

DB2OS Provides Latest AO-21/RUDAK-2 Update

DB2OS reports that this week the digital signal processing experiment (DSPE) was switched off so that no voice message will be heard on AO-21's downlink. Consequently, this will allow more time for the FM

repeater mode of operation. Currently, AO-21 operates with 9 minutes of FM repeater and one minute of 400 baud PSK telemetry. This 10 minute cycle repeats continuously throughout every hour of every day. AO-21's FM repeater mode has proven to be enormously popular with radio amateurs around the world. One factor which has made this mode so popular is the relative ease of use for the first time satellite user. With 2M and 70cm FM equipment and a simple antenna arrangement, one can easily work stations through this "repeater-in-the-sky." This allows hams who have never used an OSCAR to get a taste of satellite operation. DB2OS feels that once they have tried AO-21's FM repeater mode, the first-time user might be inclined to try some of the other OSCARs. All are encouraged to try AO-21 with its uplink on 435.016 MHz and the downlink frequency of 145.987 MHz. DB2OS further adds that currently new software is being written to investigate other modulation techniques and so this extended FM repeater operation may change soon.

[The AMSAT News Service (ANS) would like to thank DB2OS for this bulletin item.]

AMSAT OPERATIONS NET SCHEDS

HR AMSAT NEWS SERVICE BULLETIN 263.03 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 19, 1992 BID: $ANS-263.03
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule

AMSAT Operations Nets are planned for the following times. Mode B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz and the Mode J/L Nets on a downlink of 435.970 MHz.

Date UTC Mode Phs NCS Alt

26-Sep-92 1445 B 162 VE2LVC W9ODI
3-Oct-92 1830 B 162 N7NQM W5IU
10-Oct-92 2120 J 145 WB6LLO WA5ZIB

Any stations with information on current events would be most welcome. Shuttle contact reports would be of interest. In the unlikely event that either the Net Control Station or the alternate do not call on frequency, any participant is invited to act as the NCS.

Slow Scan Television on AO-13

SSTV sessions will be held on UTC Saturdays and Sundays. Mode J on a downlink of 435.980 MHz, and Mode B immediately after Mode J on 145.960 MHz. OPS NETS will take priority so look for SSTV activity immediately after they conclude.

Mode-S : MA 40 to MA 50 !<- S transponder; B trsp. is OFF!
Mode-LS : MA 50 to MA 55 !<- S beacon + L transponder
Mode-JL : MA 55 to MA 70 ! This schedule operates
Mode-B : MA 70 to MA 256 ! every orbit, every day.
Omnis : MA 160 to MA 10 ! Blon/Blat 150/0

Mode B users are reminded that at MA 40, the Mode B transponder will be heard to go OFF with a click. Although you will still hear the Mode B beacon, do not attempt to uplink as you will get no Mode B response; however, you could interfere with Mode S. Mode B returns at MA 70.

Note too that this schedule operates every orbit, every day.

QST de G3RUH 1992 Sep 10. Magnetorquing from attitude 150/0 to 180/0 will commence on Sep 20 [Sun] 01:19 UTC, Orbit 3268, MA count 224, and will continue for 6 perigees. Estimated interim attitudes are:

Orbit	Blon/Blat	Orbit	Blon/Blat	Orbit	Blon/Blat
3268	147/-4	3269	154/-4	3270	160/-4
3272	171/-2	3273	176/-1	3274	181/0
3271	166/-4				

Accuracy +/- 5 degrees

The new schedule will be uploaded during Mode-L, Orbit 3272. So 3272 (only) will contain two Mode J/L/S sessions: MA 40-70 and 130-160.

Magnetorquing is not an exact science, and there is always a possibility of changes to the above plan and of unannounced interruptions to the schedule.

G3RUH/DB2OS/VK5AGR *** Future AO-13 Transponder Schedule ***
Mode-B : MA 0 to MA 130 ! from 1992 Sep 21 - Nov 23
Mode-S : MA 130 to MA 140 !<- S transponder; B trsp. is OFF!
Mode-LS : MA 140 to MA 145 !<- S beacon + L transponder
Mode-JL : MA 145 to MA 160 ! This schedule operates
Mode-B : MA 160 to MA 256 ! every orbit, every day.
Omnis : MA 235 to MA 30 ! Blon/Blat 180/0

STS-47/SAREX BIG SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 263.05 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 19, 1992 BID:$ANS-263.05

TO ALL RADIO AMATEURS BT

The STS-47 Mission is nearing a close. Landing is schedule for 11:19 UTC on Sunday, September 20th. The entire flight of STS-47 and SpaceLab-J has proceeded with minimum problems. The Shuttle Amateur Radio Experiment (SAREX) has produced thousands of packet radio contacts and several downlinks with schools. Crew members Jay Apt (N5QWL) and Mamoru Mohri (7L2NJY) have been active with several contacts and the equipment has preformed well during this mission.

QSL's can be obtained from:

Jay Apt (N5QWL)
806 Shorewood Drive
Seabrook, Texas 77586 USA

Please include a stamped, self-addressed envelope.
Non-US stations please include necessary IRC's or US postage ($0.50).
Include callsign worked, date, UTC, mode, frequency, and QSO number for all packet contacts.

SWL cards are available also.

AMSAT wishes to congratulate the crew of STS-47 and all the personnel involved with the SAREX mission for an excellent flight.

[The AMSAT News Service (ANS) would like to thank KD9QB for the information which went into this bulletin.]

/EX

I don't think it's got anything to do with 97.113 at all, common sense
it's emergency communications.

I think the problem is that the license class line of the table is not spaced correctly. "EXTRA" should be below "GROUP A", ADVANCED should be below "GROUP B", etc. So the answer is no. If you are a Tech class then you would be issued a callsign from Group D, since all of the calls in group C for the 4th, 5th, 6th and 7th call area have been issued.

Of course if you can receive mail in another call area, you could get a 1x3 callsign, but it might be easier to upgrade!

2907. Re: Antenna "switchboard" - HELP wanted !!!

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-19 21:50:55 UTC
From: grahj@gagme.chi.il.us
Message-ID: <1992Sep19.215055.6872@gagme.chi.il.us>
Source record: 285107

In article <1992Sep17.070453.6585@eua.ericsson.se> euamih@eua.ericsson.se (Mikael Hausmann) writes:

>Since I have plans using a number of wide band antennas (discone/duo band GP/ >log periodical yagi) I would like to be able to accomplish some sort of >cross connection between different antennas/rigs. (2m/70cm/23cm)

when I was in school at Texas A&M, the club station (W5AC) had (has) a really neat setup that just might fit your needs. in that case, there were 2 hf rigs out on the bench, and lots of different antennas (TH7 tribander for 20, 15, and 10m, 40m beam, various dipoles and slopers, dummy load, etc.) to use between those 2 rigs. the solution was basically a patch panel approach.

basically, there was a short section of RG-8 from each rig, with a quick-disconnect PL-259 connector. each of these had a label indicating which rig it was attached to. then, there was a rather heavy sheet of metal (I'd guess it was about 1mm thick) with lots of SO-239 to SO-239 connectors, and the coax to the various antennas was plugged in behind the metal face. each SO-239 on the front had a label indicating which antenna it fed, and you simply plugged the coax from the rig you were working into the antenna you needed to use.

very simple, very effective, and I certainly didn't notice any problems with this. of course, when you have a 60 foot tower on top of a 3-story building and most antennas are either at the top of this tower, or hang from it, you don't have a lot to complain about..... :-)

now, this might not be the most ideal situation for VHF/UHF, where loss in the connectors gets much more severe, but for HF it certainly seemed to be a very reasonable solution.

now, as an aside, if you don't have the space/money/whatever for the really neat patch panel, you could always do something similar to what I do here for an RS-232 patch panel --- I have 4 serial devices and 2 comm ports, so I basically ran an extension cable from each device, as well as an extension from each comm port. then, I taped all of the extension cables from the serial devices together, labelled each, and I basically have a $20 A/B/C/D switch. :-) I've used this same approach (all modelled after W5AC's setup) for antennas, too, and it works nicely. not clean, but effective just the same.

hope this helps. comments/suggestions (as always) more than welcome!

2908. Re: Suggestions for first HT?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-19 22:08:47 UTC
From: grahj@gagme.chi.il.us
Message-ID: <1992Sep19.220847.7060@gagme.chi.il.us>
Source record: 285106

I missed the original post, so I hope I have the names right....
>Brandon Lee White writes:

> I'm about to get my first amateur radio license and am looking for a
>relatively inexpensive 2m or 2m/70cm HT.

if you're in a big city, you might seriously consider a dual-bander.
here in chicago, where I exist these days, the intermod on 2m is really
horrible. I'm told by other local hams that on the higher frequencies,
it isn't as bad, but can only take their word for it, since I own a
plain 2m HT. as a result of this, I often find that the intermod actually
drowns out a *LOCAL* repeater (maybe 10 blocks away) and sometimes I can't
work the repeater because of the intermod.

other than that, look for the standard things like durability, built-in
support for PL-access repeaters, etc., and any gadgets you might find
useful (I personally am not too interested in these, but many people are).
memories are nice for when you travel, btw, so you might think about that.

oh, one other thing....and this is based on the difference between my
old HT, a Kenwood TR-2400 (I think it was a TR- --- the label got lost
a long, long time ago) and my current HT, a Kenwood TH-26AT, you should
look for one that has a good sturdy belt clip. it can be really annoying
(to say the least) to have your HT fall off your belt due to a belt
clip that just won't stay in position. the 2400's clip tended to rotate
quite a bit, and quickly loosened itself to the point of losing it.....
the 26AT's clip, on the other hand, doesn't move, period.

anyways, that's enough rambling for now...you'll probably get a lot more
(and better) suggestions from others on the net.

73s for now.

>... The feeling I got from the article was that programming a
>DSP chip is identical to programming a microprocessor like the Motorola
>68HC11 or MC6502. One just needs to obtain an assembler or compiler
>which will produce machine code for the particular DSP in question.

Basically true. The DSP architecture is typically somewhat different than
a PC CPU, but once you understand the hardware, doing assembly-language
programming just requires learning a new instruction set.

>I also
>got the impression that as far as function goes, the real difference between
>a DSP chip and, say, a 68hc11 is that the DSP chip is designed to run fast
>by pipelining and any other tricks the design engineers could stuff into the

>a really fast microprocessor with an input port for an A/D and an output
>port for a D/A converter, then why aren't DSP chips simply used as the CPU's
>for most microcomputers? I don't know of any operations that wouldn't improve
>with speed.

DSP's are customized for doing certain types of calculations blazingly fast.
Since the architecture is optimized for this purpose, the chips are not
well-suited for general-purpose computing. For one thing, most DSP's use
a Harvard architecture: data and program memory are separate. Address
space is small. With the TMS32010, for example, you only get 8 kbytes of
program memory and 288 bytes of data memory. This is fine for implementing
a digital filter or FFT, but way too little for, say, a spreadsheet or
word processor.

> I think that DSP is one of those areas where hams can really be at
>the cutting edge of technology. I also think that DSP would be a good way
>to exercise some of the trig and the little bit of calculous which is rusting
>away in my brain.

You could have a lot of fun playing around with DSP's without knowing much
math. Like many new technologies, it takes awhile before the guru's get
around to writing non-mathematical introductory theory articles that the
great unwashed can understand. George Grammar did it for single sideband
back in the early 60's. Who will do the same thing for DSP in the 90's?

SPACE BULLETIN 041 ARLS041
FROM ARRL HEADQUARTERS NEWINGTON, CT
SEPTEMBER 18, 1992
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

SB SPACE ARL ARLS041
ARLS041 SAREX TO THE RESCUE

AMATEUR RADIO BECAME A NEW STAR IN SPACE AT 3:00 A.M. FRIDAY WHEN A SMALL, BATTERY-POWERED HAM RADIO ABOARD THE SPACE SHUTTLE ENDEAVOR LINKED THE ASTRONAUTS WITH NASA MISSION CONTROL AFTER COMPUTERS HANDLING OFFICIAL COMMUNICATION FROM EARTH FAILED BRIEFLY.

THE HAM RADIO, A TINY TWO-METER TRANSCEIVER INSTALLED ON THE SHUTTLE AS PART OF THE SHUTTLE AMATEUR RADIO EXPERIMENT (SAREX) IS USED BY ASTRONAUTS TO TALK WITH SCHOOL CHILDREN AND LICENSED AMATEUR RADIO OPERATORS ON EARTH. SHUTTLE CREW MEMBERS JAY APT (AMATEUR RADIO CALL SIGN N5QWL) AND MAMORU MOHRI (7L2NJY) OPERATE THE RADIO DURING CONTACTS.

ORDINARILY, MISSION-RELATED COMMUNICATION CONTROLLED BY COMPUTERS IN WHITE SANDS, NEW MEXICO. THE COMPUTERS COORDINATE THE FLOW OF DATA BETWEEN MISSION CONTROL IN HOUSTON, TEXAS AND ORBITING COMMUNICATIONS SATELLITES AROUND THE GLOBE. THE SATELLITES, IN TURN, RELAY MESSAGES TO THE SHUTTLE, PROVIDING VIRTUALLY CONSTANT COMMUNICATION REGARDLESS OF THE SHUTTLE'S POSITION.

BUT A GLITCH IN THE WHITE SANDS COMPUTERS PLUNGED THE SHUTTLE INTO A TEMPORARY COMMUNICATION BLACKOUT. MISSION CONTROLLERS COULD HEAR PILOT JAY APT, BUT COULD NOT RESPOND TO HIM AS THE SHUTTLE ORBITED THE EARTH.

AT THE TIME OF THE OUTAGE, THE SHUTTLE WAS COMING OVER THE HORIZON TOWARD A SCHEDULED AMATEUR RADIO RENDEZVOUS WITH QUEENSLAND UNIVERSITY OF TECHNOLOGY IN BRISBANE, AUSTRALIA WHERE HAM OPERATOR ANDY JOYCE (VK4KIV) WAS STANDING BY FOR A SCHEDULED CONTACT. MISSION CONTROL IN HOUSTON ASKED LOU MCFADIN (W5DID) AND DOUG LOUGHMILLER (KO5I), HAM OPERATORS IN THE NEARBY SAREX CONTROL ROOM,

TO RELAY A MESSAGE TO APT VIA AUSTRALIA THAT COMMUNICATION SOON WOULD BE RESTORED.

''EVEN THOUGHT SAREX IS PRIMARILY AN EDUCATION PROGRAM, WE'VE ALWAYS RECOGNIZED THAT AMATEUR RADIO COULD BE A BACKUP LINK IN A NASA SPACE SHUTTLE MISSION,'' SAYS ROY NEAL (K6DUE), CHAIRMAN OF THE SAREX WORKING GROUP. ''THANKFULLY, THIS WAS ONLY A ROUTINE PROBLEM. EVEN SO, THE PERFORMANCE OF HAMS OPERATING SAREX LIVED UP TO OUR EXPECTATIONS, AND HELPED KEEP THE ASTRONAUTS POSTED. THIS KIND OF PEOPLE-TO-PEOPLE COMMUNICATION IS WHAT AMATEUR RADIO IS ALL ABOUT, WHETHER IT'S CONTACTING FRIENDS AND FAMILY AFTER A MAJOR HURRICANE HERE ON EARTH, OR RESOLVING A MINOR MALFUNCTION IN SPACE.''

MCFADIN SAYS THAT THE STUDENTS IN AUSTRALIA WERE SO STARTLED BY THE UNEXPECTED TURN OF EVENTS THAT THEY WERE UNABLE TO REMEMBER THE QUESTIONS THEY HAD PREPARED TO ASK APT AS THE SHUTTLE PASSED OVERHEAD. MCFADIN SAYS THE COMMUNICATION OUTAGE LASTED 20-25 MINUTES.

SAREX IS AN EDUCATION PROGRAM DEVELOPED JOINTLY BY THE AMERICAN RADIO RELAY LEAGUE (ARRL), THE RADIO AMATEUR SATELLITE CORPORATION (AMSAT) AND THE NATIONAL AERONAUTICS AND SPACE ADMINISTRATION (NASA).

SB DX ARL ARLD048
ARLD048 DX news

Thanks to Bob, WB2CJL, the Western New York DX Association and Garry, NI6T, for the following DX information.

KERMADEC. ZL4DO is on now with the call sign ZL8RS. He will be very busy with his work, so hamming will be limited during his one or two week stay. Watch 14216, 7087 and 3800 kHz and your local PacketCluster node for other spots.

GLORIOSO. Jack, FR5ZU/G, has been very active on RTTY, but there have been no reports of SSB or CW. Plans are to move on to Juan de Nova FR5/J, and operate there from September 21 through October 4. He will then be travelling to Europa, FR5/E, for October 5 through 15 activity. The correct QSL information is Jacques Quillet, PO Box 347, 1 Cite Metro, Chaudron, F-97494, Ste. Clotilde, Cedex, Reunion Island, via France.

NORTH KOREA. Maarti, OH2BH, reports that progress is being made on a possible P5 DXpedition, although no starting time or date has been set.

MONGOLIA. Ron, K7HDK, will be operating satellite from Mongolia September 17 through 29. He will be active on OSCARs 10 and 13. This is believed to be the first time a Mongolian amateur station will be operating through OSCARs. QSL via John, KL7GRF.

WILLIS ISLAND. Operators VK9NS, VK9NL and VK2BEX plan to spend a week here around October 7 through 14. Their Mellish Reef operation has been cancelled.

YEMEN. Europeans have been heard working 7O0ZZ and 7O1ZZ, purported to be operated by VE7ZZ. Yet according to VE7ZZ, he is not now nor

ever has been in Yemen.

BERMUDA. The Radio Society Bermuda will be holding its annual Fall operating event, the Old Timers and Whipper Snappers Field Day, on September 26 and 27. VP9SWS, Super Whipper Snapper, is scheduled to be active for the very first time during this period, pending licensing. Otherwise, the call sign used will be VP9MN. The Society station will be on 10, 15 and 20 meters only, with most activity on SSB. QSL VP9SWS and VP9MN via WB2YQH.

BAHAMAS. To celebrate the 500th anniversary of Christopher Columbus discovering the new world, the Bahama Amateur Radio Society, BARS, will be on through the month of October signing C6A500. BARS members will be signing their calls with the /500 suffix. Awards will be available.

BANGLADESH. Cards are now being received stateside for the Jim Smith S21ZA operation. Bob, S21ZD and aka G4APV, has his license but has yet to be heard on the east coast. He should be active again September 20, 21 and 22.

MOLDOVA. RO0Q will be active September 26 and 27 during the CQ WW RTTY contest. QSL via UO4OLW.

TORTUNGA ISLAND, IOTA NA-149. HH2PK, HH2JO and HH2Z will be active September 18, 19 and 20 using the special call sign 4V4H. This is an island just north of Haiti. Look for them on 80 thvough 10 meters with CW and SSB. QSL KA9RLJ.

SEPTEMBER CONTEST CALENDAR.

The Scandanavian Activity Contest CW weekend is the 19th and 20th. The SSB weekend of this contest is on the 26th and 27th. Exchanges for both events are signal report and QSO serial number.

The CQ World Wide RTTY Contest on the 26th and 27th. RST, State, CQ zone.

EASTERN KIRIBATI. A group of Northern California DXers will operate T32RA from Christmas Island, IOTA OC-024, September 23 though 28, including the CQ WW RTTY Contest. Outside of cont hours, they will operate 160 through 10 meters with SSB and CW. I□ok for T32RA by KN6J, T32CW by NI6T, T32GV by W6OTC, T32RS by N6OXR, T32WS by WU6A, T32SS by KE6FV and T32GG by KE6GG. QSL their home calls.

SOUTH SANDWICH. The first of the VP8SSI cards are beginning to show in the mails. Please exercise your patience a little longer, as the managers have about 40,000 cards to complete.
NNNN

Good Luck on DX de KB8NW/OBS

SpaceNews
=========

MONDAY SEPTEMBER 21, 1992

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* STS-47 SAREX SUMMARY *
========================
The latest in a series of Amateur Radio Experiments flown in US Space
Shuttle missions can only be described as a complete success. Not only
did astronaut/hams Jay Apt (N5QWL), and Mamoru Mohri (7L2NJY) make many
packet and voice contacts with ground stations on Earth, but the SAREX
radio equipment also came to the rescue on Friday when a communications
malfunction prevented normal Shuttle communications with Mission Control.

Communications were relayed to the ground using the SAREX portable 2-meter
FM transceiver. Amateur Radio has always played an important role in
providing communications in circumstances where regular communication
links have failed, but this was the first time Amateur Radio emergency
communications was used in space. This comes after emergency traffic
was recently passed through OSCAR-13, LUSAT, and UoSAT-OSCAR-22 in the
wake of hurricane Iniki, another Amateur Satellite "first".

During "normal" SAREX operations involving packet radio communications,
the "Robot" firmware contained in the SAREX TNC performed flawlessly
keeping a log of contacts, and transmitting short beacon messages generated
by the astronauts. A few examples of the packet transmissions copied in
New Jersey follow:

W5RRR-1>WA8EBM [13-09-92 14:41:36] :
#638-is your STS-47 SAREX QSO number.

W5RRR-1>QSL :
WB4TBF/1209 KF5OJ/1205 KC4NHB/1204 N4TAE/1199 KC0LM/1198 W5VZF/1197 K0KJ/1195
YI1BGD/1181 KB1US/1138 KI4FN/1126 VK7ZBX/1115 VK7ZO/1114 VK6OD/1086
DL0CRE/1044 DL1YDD/1043
```

W5RRR-1>SAREX :
This is STS-47 SAREX Robot station W5RRR-1
onboard the Space Shuttle Endeavour.

W5RRR-1>QST :
It is 36 hours since launch, and everything is settling down to the routines of the wonderful life up here. We have had some wonderful views of Japan, Chicago, Boston harbor, China, and Kamchatka. We have seen the southern aurora. We just saw the lights of Palmer station on the Antartic peninsula. Many countries have connected to us...keep having fun! 73, N5QWL.

During this SAREX mission, an uplink frequency of 144.700 MHz was used for packet operations. This caused some interference in areas served by FM voice repeaters having input frequencies close to the 144.700 MHz uplink. In one instance, emergency communications to a stranded motorist was interfered with by ground stations attempting a packet connection with SAREX. A solution to this problem is currently under investigation.

QSL cards are available for all who either heard the Shuttle or actually made two-way radio contact with the SAREX package. QSLs should be sent along with an SASE to:

Jap Apt, N5QWL
806 Shorewood Drive
Seabrook, Texas 77586
USA

Stations outside the US should include at least $0.50 or equivalent IRCs for return postage.

* NEWS AWARD FOR ZS6BTD *
==========
SA AMSAT has awarded the "Spirit of Achievement Award" to Gerald Klatzko ZS6BTD for his tremendous efforts in transmitting regular Amateur Radio News Bulletins. The award was announced at SPACECON 92, SA AMSAT's annual conference held in Johannesburg on September 12.

For many more years than anyone wishes to remember, Gerald has backed up Hans van de Groenendaal ZS6AKV in presenting the Sunday morning SA AMSAT Net. He also carries out the simultaneous relays on 20 and 40 meters.

Gerald is also responsible for the South African Radio League, Johannesburg daily Amateur Radio News Update which goes out on two meters 13 times each day. He compiles and records two editions of the bulletin per week. During SAREX missions or other important events bulletins are often updated several times per day.

With the Spirit of Achievement Award SA AMSAT wishes to recognize Gerald for the tremendous contribution he is making to the development of Amateur Radio and in particular Amateur Radio Space Communication.

[Info via ZS6AKV]

* AO-13 HAS A NEW ATTITUDE *
============================
Magnetorquing from attitude 150/0 to 180/0 began on Sunday,
September 20th at 01:19 UTC on orbit 3268/224, and will continue
for a total of 6 perigees. Estimated interim attitudes are:

Orbit Alon/Alat Orbit Alon/Alat Orbit Alon/Alat

3272 171/-2 3273 176/-1 3274 181/0
3268 147/-4 3269 154/-4 3270 160/-4
3271 166/-4

Accuracy +/- 5 degrees

The new schedule will be uploaded during mode-L, orbit 3272. So only
3272 will contain two mode-JLS sessions: MA 40-70 and 130-160.

Magnetorquing is not an exact science, and there is always a possibility of
changes to the above plan, and of unannounced interruptions to the schedule.

[info via James Miller, G3RUH]

* FO-20 NEWS *
==============
Mode JA transponder operation is scheduled from September 30th at 01:55 UTC
through October 1st at 02:23 UTC.

[Info via Kazu Sakamoto, JJ1WTK]

2923. Motorola radius mobile question

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-20 20:00:53 UTC
From: chinatti@phoenix.Princeton.EDU
Message-ID: <1992Sep20.200053.9372@Princeton.EDU>
Source record: 285113

I have a question about a motorola radius mobile radio which I am considering purchasing. In the 16 channel model, with no signalling options, I have encountered 2 different flavors of the radio. The difference is how it treats ungrounding the microphone during scanning. The first type completely dumps you out of scan mode, and when you re-ground the mike you are no longer scanning, and the second type temporarily disables scan and the display blinks between the scan bars and the current channel, and then puts you back into scan when you re-ground the mike. I have seen the 16 channel models of both the MaxTrac and Radius line do either of the two things. Is this a software difference, a firmware difference, or a hardware difference? Is anyone familiar with this difference? I would greatly appreciate a reply, either through e-mail or posting to this group.

Thanks in advance,
Steve

> on Mode S or mountain topping now.
>
> Bob

I totally agree with Bob's comments on the Kenwood TS790 versus
the Yaesu FT-736R. The satellite operation ergonomics on the 790
are terrible, and what else do you need to say about a radio that
uses a UHF connector on 70cm?

There are certainly aspects of the 736 that could be improved --
the memory handling is certainly not all that great, but in general
it is a joy to use. I've used mine for satellite work for several
years and more recently on 432 EME.

I have no personal experience with the ICOM 970, but I'm led to
believe from talking to others that it has serious shortcomings.
Specifically, you MUST receive on the sub-VFO, which means you
have to use the cheesey LCD S-Meter rather than the larger,
traditional one. Also, I believe that ICOM's concept of ALWAYS
requiring you to transmit on the main VFO means that if you want
to tune your downlink frequency (on the SUB-VFO) it tracks
backwards (i.e. counterclockwise to go up in frequency on the
downlink.) I draw these conclusions from a careful reading of
the specs and from talking to ICOM reps at various shows. Can
anyone with first-hand knowledge confirm these problems?

2926. 902-928 antennas?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-20 22:17:59 UTC
From: dennis@nanovx.uucp
Message-ID: <1992Sep20.221759.21869@nanovx.uucp>
Source record: 285116

I've been looking for antennas/designs for antennas for 902-928 or design programs to build my own. This is for a project to use existing commercial gear to build a IP type network. Ideal characteristics would be 75 ohm, 15+ dBi omnidirectional. Omnidirectional is great, but not necessary. I'm even looking into dishes, but these have to be light. Can't have a heavy dish up high enough to go over all of the trees...

Finding them has been a real trip. Down East Microwave has a loop yagi, which is the only antenna I've found to date. Cost around $90. In the dish category, I need to contact TEST INC about their grill dishes.

Some can't. Not all countries are as liberal as the US in allowing the
public to monitor wherever they want. They may need a license to own a
receiver...

> and antennas and short patch cables to interconnect them in the
> desired configuration?

Why not use BNCs? They are cheaper, yet will handle full Amateur legal
power to 4 GHz (some up to 11 GHz), and are quicker to
connect/disconnect.

I can't help with the particular problem, but I would like to point out
that any problems with the radio equipment would _not_ result in lost
packets. The error checking in the AX.25 protocol would catch that, and
re-send the packet.

Sounds like a problem with the sending program (MSYS).

2932. Re: Motorola radio information?

> etc.?

Frequency is dependent on the model and programming. Power, I believe,
is programmable, up to about 5 watts. I've seen them for both commercial
high band (150-180 MHz) and UHF (450-470 MHz). I don't know if they are
available for the other bands.

It seems it was about a year or so ago that we got to the present
structure of r.r.a.policy, r.r.a.misc, r.r.swap, ...
It was accomplished with much heated debate (can you say "religious issue"?).

Well I can help you out there. If you got your elements from that
archive then the "bird" will be listed by it's host. Its a piggy back
transponder on "Informtr-1". and the number designator is 21087. I hope
that helps.
Also, I've listened to the downlink a couple of times. It's not as
loud as the Dove. I had to drop the squelch off to hear it at my location
at least on that pass. Good luck. Mike Nason KA7HBB

> > My 528 tone squelch works perfectly; I use it on a near-daily basis.
>
> Do you not find it sometimes misses the beginning of the conversation, or
> cuts in half way through an over?

Mine works great! As an added diagnostic to the problem, try using
stereo quality headphones with the DJ-580T. The builtin speaker
reproduces the low freqs *very* poorly but the headphones will
let you here what is there. Mine have shown me which repeaters
have audio band limiting (and which don't) and which have PL encode enabled.
Very often, on the repeaters that don't have audio bandwidth limiting,
you can here people who have their PL enabled even though it's not
used for that repeater. Once you know there's a PL there you can
enable your PL decode (T.SQL) and then scan manually for the PL
freq being used. To date, I have noticed no delay in breaking squelch
with PL decode.

crv

2938. DSP-12 vs AEA?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-21 13:08:20 UTC
From: MROWEN%STLAWU.BITNET@cunyvm.cuny.edu
Message-ID: <9209211308.AA16482@ucsd.edu>
Source record: 285120

I'm considering buying one of the "DSP-boxes." I'm
not very knowledgable about the capabilities of the
two products in the marketplace, the DSP-12 from LLGrace
or the '2232 (?) from AEA.

A few weeks ago the net read a comparative review of
both boxes which was illuminating. However, it was
not an entirely unbiased discussion (containing, as it
did, quite a bit of personal QRN). I wonder if anyone
else on the net might have first-hand acquaintance with
both units. I'd especially like to know such trivial
things as what modes are supported, how easy is it to
actually use the modem, how reliable it is (from both
hardware & software standpoints), etc. I'm not likely
to get into the guts of the thing and write my own modem
code, so "open architecture" isn't an issue. I just want
a modem that does _everything_ right the first time.

Michael Owen W9IP

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 079 (OPDX.079)
September 21, 1992
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, DXNL, DF4RD, AD1C, KE2LJ, WB3LHD, JH1FDP, K4CEF & Southeastern Cluster Group, KD7E & Central Arizona DX Association PacketCluster, The DX Bulletin, W8BE, WB8LFO, WA8MEM, K0GU & Front Range DX Cluster, PA3FYV and VE3CDX for the following DX information.

4J1, MALYJ VYSOTSKIJ/RAVANSAARI ISLANDS. An international team headed by Romeo, 3W3RR/AA2FW, and Frank, OH2LVG/AA7FM, is headed to M-V Island for what may be the last operation from this island using the 4J prefix. The 4J prefix is likely to be assigned to Azerbaijan in January, 1993. The group which includes operators from Finland, Mexico, Russia and United States will commence operations on October 22th and then depart the island after the CQ WW Phone Contest on October 26th. Activity will be on the usual DX frequencies. Operators will be Romeo/3W3RR, Tomi/OH6EI, Pekka/OH2BVF, Frank/OH2LVG, Andy/UA3AB, Willy/UW9AR, Victor/XE1VIC and ED/NT2X. QSL via OH2LVG, Vanhaistentie 5 E 73, 00420 Helsinki, Finland.

4U, UNITED NATIONS, HQ. The United Nations station 4U1UN will begin operating with the callsign of 4U47UN starting within the next few weeks, and lasting until the end of October, 1992. The callsign will be used in celebration of the 47th anniversary of the United Nations and the opening of the 47th session of the General Assembly. Please QSL to W8CZN or WB8LFO, either route will get you the QSL.

8P, BARBADOS (IOTA NA-021). Rick, NE8Z, will be active from Sam Lords Castle on the southeastern portion of the Island from October 26 thru November 3. He will not be active in the CQ WW Phone Contest. His call sign is unknown at this time, but it will be issued upon his arrival. Rick hopes to receive one of the following callsigns that he has requested: 8P9DR, 8P9EE or 8P9MD. Activity will be mostly CW on 10-40 meters (25 kHz up from the bottom of each band.). Also, check 50.110 MHz and the IOTA net SSB frequencies of 14260, 21260 and 28460. Rick mentioned there will be some SSB/CW WARC activity. During his week stay, his goal is to work DXCC. QSL via K8LJG. He would appreciate USA QSLs for his USA-CA award via his QSL Manager or via W8-Bureau.

9G, GHANA. It has been reported by The DX Bulletin that John Longhurst, G3VLH, recently met with Kofi Jackson, 9G1AJ, Director of Ghana Frequency

Registration and Control Board. Kofi stated that the ban on amateur radio activities will be lifted on January 15 when Ghana reverts to civilian rule.

9N, NEPAL. Kiyoko, NH6RT, the YL who went island hopping thru the Pacific a year or so ago is now in Nepal. She will be there 2-3 years and hopes to obtain a license.

C9, MOZAMBIQUE. C9RJJ has been quite active this week on CW. Check around 7005/0300z, 14012/2100z and 21030/1900z. Also, there has been activity on RTTY, check 14080 kHz around 2300z. For SSB check 21205 kHz around 1645z and 28411 kHz around 1615z. QSL via W8GIO.

CY, SABLE ISLAND. VE1CBK and three other operators, including one YL operator, will operate from Sable Island from October 2nd thru the 9th. The callsign has not yet been determined. (TNXS Mike Witkowski)

D2, ANGOLA. D2EL has been quite active all week on or around 28488 kHz starting around 2030z to as late as 2315z.

FR/J, JUAN DE NOVA. Jacques, FR5ZU, who just finished up his DXpedition to Glorioso, will travel to Juan de Nova on September 21 and will be active until October 4. Look for him to be active again on RTTY; check around 14083 and 21083 kHz.

FW, WALLIS ISLAND. Yutaka/JR1LZK, Yasunori/JI1NJC and Shinji/JA5VBH will be active October 28 to November 3. The callsign is unknown at this time, but the three operators will be using the same callsign. Operations will be on 160-6 meters including the WARC bands. CW and SSB shall be the main mode of operation, and RTTY operation is now under consideration. QSL via JI1NJC.

PA6QRP, SPECIAL EVENT STATION (Netherlands). OPDX received this information (via packet) on Sunday, September 20, a little late, but you still have until September 22 to look for PA6QRP. This QRP station will be operated by Ad/PA3AHL, Rob/PA3BXR, Bart/PA3DUS and Frans/PA3FYV. They will be QRV from a special location near the coast, and operate 10-80 meters on the international QRP frequencies. They will be using full size Delta-loops for each frequency. Operations will be mainly CW, but some SSB will be tried. They will confirm QSOs with a special QSL card via the bureau.

SAD NOTE. Christain, FY5AN (ex-FY7AN), became a silent key 9/19/92. Apparently he fell from a tree while trying to trim branches which were in the way of his tower. OPDX and NODXA wish to send our deepest condolences to his family.

T2, TUVALU. Marcel, ON4QM, is currently active as T20CB. He has been reported on 15 meters SSB by the Southeastern Cluster Group.

TA, TURKEY. Don, W3RDF, was heard mentioning that he will be QRV as TA2ZD beginning October 1. He will be in Turkey on business and will concentrate daily on the QRP frequencies from 0300-0430z.

V63SM REPORT. Shima, JQ3EEL, reported to OPDX that his V63SM DXpedition to Micronesia netted about 1800 QSOs. He stated conditions were not good, but was able to work some USA stations on 40 meters. Shima plans to return again, but did not indicate when. QSL V63SM to JQ3EEL: Manami "Shima" Shimazaki, View-Haitsu Moriguchi 210, Kawahara 21 Moriguchi, Osaka 570, Japan.

VK9, WILLIS ISLAND. The HIDXA has decided to activate Willis Island, but has cancelled the trip to Mellish Reef. Jim/VK9NS, Kristi/VK9NL and Atsu/VK2BEX will be active as VK9WW from October 7-14. Jim promises plenty of RTTY, etc.....

XY, MYANMAR. Stations from both the east coast and the Ohio/Penn Network were hearing a station signing XY0Q (or was it XY0Z). Activty seems to be between 1430 to 1930z. The first spot on the Ohio/Penn Network was on September 17, 14180 kHz at 1852z by a G0 station. The G0 station reported that this is a JA DXpedition. Other frequencies reported were 14032 kHZ at 1800z and 7003 kHz between 1230 to 1330z.

DX TIDBITS..... ZL8RS did indeed show up for a one day operation on September 17th. Activity was reported on three bands 75, 40 and 20..... On a personal note, from Jay K0GU: In Colorado we are now consistantly working UD6, UL7, UJ8, etc.. on 40 meters longpath CW around 1300z. Won't be long till the lowbands are back!..... QSL CARDS IN THE MAIL: S21ZA and VP8SSI cards..... Many were delighted to hear the announcement by the DXCC that 5R8JD has been accredited for DXCC with operations beginning July 6, 1988. Also accredited was S92IJ (10/MAR/92) and S21ZA (Aug 1992)..... YX0AI cards have been received from the printer and the process of sending them out should begin..... Terry, W6MKB, expects to receive the VP8CBA cards from the printer in about two weeks..... NODXA member Jean Louis, 6W6JX, stated that September's CQ Magazine has F6FNU for his QSL Manager and this is incorrect. F6FNU has not been his manager since August 15, 1990. Jean states, QSL to his 1992 callbook address only.....

OOPS DEPARTMENT! Last week OPDX mentioned Pete, W1RM, was collecting the YX0AI information. This is wrong! Jim, N3JT, is the person who is acting as a go between on behalf of the YX0AI group. Sorry Pete....

SPECIAL NOTE FROM EDITOR: There will probably be no bulletin next week (September 28). I have some personal obligations to attend to next weekend. Please keep sending your DX information. (You never know, I may put one together if I receive enough information before I leave.)

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

First thing... the column headings for above are WRONG. They should be:

>% DISTRICT GROUP A GROUP B GROUP C GROUP D
>% EXTRA ADVANCED TECH/GEN NOVICE

That may clear up some confusion...

Here's another 'silly' question....

If a TECH/GENERAL in the 4,5,6,7 areas *really* wanted a GROUP C callsign, I suppose if you wanted to get tricky, if you knew someone in a call area such as "3 land" who would let you use their address (relative, etc), I guess you could apply for a change of address to say, Pennsylvania and get a N3xxx call. Then a little while later apply for a change of address back to your real address but keep the "3" call. I mean if you *really* wanted one bad enough. Anyone ever do this? I guess it is 'legal' as long as you have a

good address to use in "3 land", relative, etc who would forward any mail
from the FCC back to you.

Cross-posted to: rec.radio.amateur.misc,rec.radio.swap

In a recent article n4hy@idacrd.UUCP (Bob McGwier) stated that your entire development system cost less
than a complete development sytem from...

I tried email but it bounced soo here is my reply.

Less than $168.00?

I just bought an hc16 evaluation board from Motorola for 168.00.
It included
software:
assembler
simulator that allows one to simulate the dsp on a peecee without any connection to the dsp
a real time monitor that allows inspection of memory setting of break points etc.
a peecee filter design program
a demo copy of a C compiler with source debugging window. Full price was $149.00 I think.
several sample programs.

hardware:
board requires +5 @ 100ma
64K bytes of static ram
68hc16 dsp capable of sampling up to 32K/second X 8 chanels
piles of books
a demo board that allows one to build a 5 bad graphic equalizer display with 8 segments/band

OK, i'll admit, It was a special promotional sale. I don't know what the
'normal' price is. But I'm not connected er nothing, I just called the nearest
motorola dealer in Cleveland and told them I wanted one and sent them my money.
I ordered it in march and it finally arrived. Now I' struggling with the math
to try and figure out what to do with this latest toy of mine :-)

I don't know how the hc16 compares to other dsp enginees, maybe your going to tell me
that is is kind of wimpy. The cpu clocks at a max of 16.8Mz

2944. WA1HAM - A true story

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-21 14:19:06 UTC
From: tim@shovel.Prime.COM
Message-ID: <1992Sep21.101906@shovel.Prime.COM>
Source record: 285126

Just a point of interest... my oldest brother had the callsign WA1HAM about 25 years ago or so as a Novice class and let it expire :) No joke! I did the same thing with mine (KA1ECW)... my other brother (KA1ECX, Tech) and my Dad (WA1ETX, Gen) are trying to get me to get my no-code Tech packet lic. ...

BTW, Dad is getting his new hip put in today- wish him well if you talk to him in a few days or so! (Can I bring handheld ham stuff into a hospital? I wonder.... *grin* have to wait for the morphine to wear off before I hand him any expensive equipment, tho)

2945. batteries

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-21 14:20:32 UTC
From: pjml@swmis.nerc-swindon.ac.UK
Message-ID: <21719.9209211518@swmis.nsw.ac.uk>
Source record: 285029

I have examined several batteries that have suffered 'sudden death'; in all cases they have been the 'maintenance free' types, and the problem has been that one cell has almost no electrolyte in it.
In the old days of batteries with removable caps, you could simply put more distilled/deionised water in, charge the thing, and put it back in service.
These days, you take a chisel to the 'non removable' cell cover (*anything* is removable if you use a big enough hammer) and refill it that way. Problem then is the top wont fit and so the acid sloshes out first time you go round a bend....
Batteries 'recovered' this way do, however, work fine for powering ham radios in the shack... i know, i have three at home, given to me because they would not start Hondas...
Stand the batteries in plastic bowls or buckets if you are worried about acid burns on the shack carpet, and keep dogs/cats/small children/naked flames away too.

I suppose the burning question is: Are they valid for DXCC ??
There's been no announcements in the DX bulletins about this trip, which
I suppose isn't all that unusual. However, I'd still be a lot more
comfortable knowing their status!

2947. Omni Antennas for 902-928 MHz

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-21 14:34:15 UTC
From: rc@cmr.ncsl.nist.gov
Message-ID: <9209211435.AA05176@cmr.ncsl.nist.gov>
Source record: 285030

N4ZMZ asks for suggestions on omnidirectional antennas for the 33 cm band. First off, I con't know of any ham-style commercial products. There are, however, a number of fairly simple antennas you could build:

Vertical Polarization:
1. J-Pole. You could fairly easily put together a homebrew version of the Cushcraft J-pole. This consists of a bunch of Js sidemounted on a pole. By making all the feeds the same length, and all the Js the same side up, you wouldn't have any phase-error/beam-tilt problems. A quarter-wave matching section where the feeds join would get you back to your desired feed-line impedance. See the ARRL antenna book for more details.
2. Phased half-waves. Again, you could put togethera set of phased half-waves, mounted in some low-loss plastic tubing. The half-wave sections should be of some high-velocity coax, airline would be best. At the end of each half-wave section, the center conductor of the lower section connects to the outer conducter of the next higher section, and vice versa. You need high-velocity coax so that the speed within the coax is (nearly) the same as mechanical length of the "half-wave" piece. More than a small number of elements would run the risk of enough phase error to get too much beam tilt. You would have to match to your feed with a quarter-wave section.

Horizontal polarization:
3. Slot or Pylon. Take a metal pipe about one-eigth wavelength in circumference. cut length-wise slots one-half wavelength long one after another up the same side of the pipe. Spacing isn't vitally important. Feed all the slots with the same length coaxes (inside the pipe). match to your feed line where the short feed coaxes come together. RCA sold a lot of these to FM broadcast stations in the late 1940s. I think microwave versions are in use today.
4. Side-fire helix. Not so easy to describe, but the basic idea is that you take a pipe (larger than that for the Pylon?), and wrap a helix around it on stand-offs out about a quarter-wave (?). The diameters are chosen so that the current in the helix turns are in phase when observed from any distant point. This means that each turn of the helix must be a multiple of a wavelength (?). Since I understand this design so poorly, I would have to look it up in some antenna books, or use one of the above simpler designs. GE sold side-fire helixes to a number of UHF TV stations.

Beside the ARRL antenna book, there are many others. A little superficial info can be found the Sams/ITT Reference Data for Radio Engineers. I suspect that most of the active publication in this field was during the formative days of FM/TV/UHF-TV in the 40s, 50s, and 60s. See the various IRE Professional Group pubs during that period. (They will be under IEEE today, due to the merger.)

73, Bob W3OTC

Funny, I've noticed (from the vendor end of the transaction) that the harder
a buyer pushes me to take his check, the more likely it's rubber. I have
been stiffed by fellow hams several times for several hundred dollars. Some
I recovered in small claims court, some was out of state and not worth
pursueing. I no longer accept checks at hamfests (unless they agree to let
me ship the item to them after the check clears). I would suggest others
do the same.

I have done a few half cash, half check deals and never got stiffed on these.

Clearly, the solution is to start issuing calls with non-English Latin characters; e.g. they could restart the Extra pool with (say)

"" "
AA0A (that's A-umlaut, didahdidah)

Of course, the FCC's gas-fired computer system would need to be upgraded.

2950. Kenwood TH-28A mods, and antenna questions.

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-21 14:58:54 UTC
From: gaspar@inf.ethz.ch
Message-ID: <1992Sep21.145854.5074@neptune.inf.ethz.ch>
Source record: 285032

As I am interested in purchasing the Kenwood TH-28A FM HT, I have a couple questions:

1) what excactly is the "minor-modification" that kicks the Tx range up to 136-173? Is it just a standard cut/add diode type deal?

2) are there any other "quickies" that can be done to this midget?

3) My final question will probably be considered ultimately stoopid, but: can I extend the rubber antenna with standard BNC connectors and shielded cable? The specs say 50ohm impedance, so standard ethernet cable should work? I'm only talking about 1 meter or so.

AND, if anybody has any horror/joy stories about the th-28, I would appreciate any input.

thanks in advance,

--gaspo.

Tell your friend to check out the new Yaeus FT-890. It's priced around $1200 or so, depending on options, and is, in my humble opinion, the best deal going. The automatic antenna tuner option is well worth the price, too. Good luck.

In rec.radio.amateur.misc, alanb@hpnmdla.sr.hp.com (Alan Bloom) writes:

* Today I finally remembered to bring some UHF adapters from home so
* I could do some relative measurements of UHF versus type-N.
* As expected, the type-N showed lower insertion loss at high
* frequencies, but the UHF connectors were hardly "5 dB attenuators."

--------- Type N ---------- ---------- UHF ------------
FREQ (MHz) TOTAL LOSS PER CONNECTOR TOTAL LOSS PER CONNECTOR
1.8 0 dB 0 dB 0 dB 0 dB
30 0 0 0 0
100 0 0 0 0
150 0 0 .02 .01
200 0 0 .03 .015
450 0 0 .18 .09
600 0 0 .26 .13
900 0 0 .66 .33
1000 .05 .025 .8 .4
1300 .1 .05 .86 .43
1600 .05 .025 .5 .25
2000 .05 .025 .02 .01

* Bottom line: UHF connectors work fine through the VHF range, and
* are not too bad even on the 420 MHz band if you can stand about
* .1 dB mismatch loss per connector.

Now do the same test with 90 degree elbows. Some of the UHF right angle
connectors are really bad. The good ones are ok for VHF and terrible at
UHF. The bad ones use a spring as the center contductor! I don't have
the parts or the data handy but I've done similar tests. Maybe I'll
redo the test and post some data.

Good data, many thanks Al. A couple of questions: First, what is the
point of the two 10dB attenuators? Second, how about the other
parameter, reflection coefficient or VSWR? Can you try this with
various lengths of cable as well to eliminate the effects of the
'conjugate match' you spoke of? I'm surprised they show up as that
good, though I doubt I'll give up my N connectors! :+)

I am interested in what a HAM (or listener for that matter) can do with the various satellites 'up there'. I have a tracking program and get the elements from this forum (My thanks to those who contribute them.). What I don't have is much of an idea what each of those satellites does. Is there a good reference on what I can do with them and/or how to do it?. I have listened to AO-21 several times using my FT-470 and a simple ground plane antenna but would like to do a bit more than just that!. Better antennas and a power amp should let me talk thru that bird.

Yes, there was something in QST a couple of years ago about this. If you
get caught, the FCC can and will do bad things to you...

On a somewhat unrelated note, maybe we need to rethink why we still have
callsign districts. If we no longer require people to change calls when
they move to another district then why have them. Why not just start with
A1AA and when you reach A1ZZ move to A2AA, etc. It seems to me we are
living under meaningless constraints when some districts have 1x2 calls
and others don't!

Just my 2-cents worth!

From: frankb@hpsad.sad.hp.com
Message-ID: <27890028@hpsad.sad.hp.com>
Source record: 285057

*Today I finally remembered to bring some UHF adapters from home so
*I could do some relative measurements of UHF versus type-N.
*As expected, the type-N showed lower insertion loss at high
*frequencies, but the UHF connectors were hardly "5 dB attenuators."

--------- Type N ---------- ---------- UHF ------------
FREQ (MHz) TOTAL LOSS PER CONNECTOR TOTAL LOSS PER CONNECTOR
1.8 0 dB 0 dB 0 dB 0 dB
30 0 0 0 0
100 0 0 0 0
150 0 0 .02 .01
200 0 0 .03 .015
450 0 0 .18 .09
600 0 0 .26 .13
900 0 0 .66 .33
1000 .05 .025 .8 .4
1300 .1 .05 .86 .43
1600 .05 .025 .5 .25
2000 .05 .025 .02 .01

*Insertion loss increases until about 1200 MHz, and then starts to
*decrease until it is almost zero for the UHF connector at 2 GHz!
*At this frequency, the connectors are about 1/4 wave long (1 inch,
*assuming .66 velocity factor), so I assume that the two adapters
*are providing a conjugate match to each other. This confirms my
*assumption that the insertion loss is due to reflections (impedance
*mismatch), not absorption (true power loss).

If you assume that all the loss is due to mismatch, then the SWR of
the connectors can be calculated from the loss.

The Reflection Coefficicent p (normally the greek letter rho) is related
to SWR:
(SWR - 1) / (SWR + 1) = p or SWR = (1+p)/(1-p)

The mismatch loss is: loss in dB = (-10 Log(1-p*p))

so:

--------- Type N ---------- ---------- UHF ------------
FREQ (MHz) TOTAL LOSS Total SWR TOTAL LOSS Total SWR
1.8 0 dB 1 0 dB 1
30 0 1 0 1
100 0 1 0 1
150 0 1 .02 1.15
200 0 1 .03 1.18

450 0 1 .18 1.50
600 0 1 .26 1.64
900 0 1 .66 2.20
1000 .05 1.24 .8 2.39
1300 .1 1.36 .86 2.47
1600 .05 1.16 .5 1.98
2000 .05 1.16 .02 1.15

In case anybody cares.

Hi,
I have recently built a Tesla coil with a 4' x 4.5" secondary
wound with #24 wire (approx 2000 turns) driven by one half of a
15kV centre tapped neon sign transformer, 15nF of primary capacitance,
a primary coil consisting of 16 turns wound on 1' square former tapped
for resonance and variable spark gap (~1/2"). The result was lots of noise,
ozone and regular sparking out to a distance of around 14".

What I would like to know is :

(1) - is this a resonable output from such a coil? (I had kinda hoped
for longer sparks... sigh!)

(2) - if not, could any of you Tesla/RF Gurus suggest some mod's to improve
performance.

(3) - is there any optimum length/width ratio for the primary and secondary
coils?

(4) - what kind of voltage does it require to break down 14" of air ?

Also I have heard of vacuum tube Tesla coils, but know nothing about them.
I presume they replace the spark gap oscillator with a tube power oscillator.
Does anyone have a circuit for one of these or know what sort of output
can be obtained by one ?

Any help in answering any of these quetions would be greatly appreciated,
as would anyones stories relating to their experiences with these very
entertaining devices.

Thanks in advance,

Malcolm

>>Then I repeated the measurement with the N adapters replaced with UHF.
>>I normalized the measurements by replacing the 3 adapters with a BNC
>>double-female. (That is, this was assumed to have 0 dB loss.)

>Good data, many thanks Al. A couple of questions: First, what is the
>point of the two 10dB attenuators?

The attenuators guarantee a good 50-ohm match at both ends. If I had performed the full 2-port error correction (involves calibrating the network analyzer with shorts, opens and 50-ohm loads at each port), then I wouldn't have needed the attenuators.

>Second, how about the other
>parameter, reflection coefficient or VSWR? Can you try this with
>various lengths of cable as well to eliminate the effects of the
>'conjugate match' you spoke of? I'm surprised they show up as that
>good, though I doubt I'll give up my N connectors! :+)

The conjugate match was my explanation for why the insertion loss decreased to near zero dB at 2 GHz. At that frequency, the impedance "bump" of each connector/adapter is about 1/4 wavelength from the other connector. My theory is that the reflection from one "bump" comes back in the proper phase to cancel the reflection from the other bump. No reflection means all the signal goes through with no attenuation. The length of the cables would have no effect on this.

There's no question that type-N connectors are better than UHF. There exist specially-manufactured N connectors that work all the way to 18 GHz. UHF connectors crap out above a few hundred MHz. But they are readily-available and cheap, and there's no reason not to use them.

From: hunter@s07.es.llnl.gov
Message-ID: <136876@lll-winken.LLNL.GOV>
Source record: 285043

I need a low power time code receiver for some seismic instruments. It has to work world wide, so that leaves out WWV receivers. We normally use Omega or GOES receivers, but these are rack mount items and use a lot of power. The GPS receivers that I have seen have accurate time, but consume one to two watts. These could be powered up occasionally update a crystal clock, to save power. Any better ideas?

>>location.
>
>Yes, there was something in QST a couple of years ago about this. If you
>get caught, the FCC can and will do bad things to you...
>

I would like to see the documentation. I see absolutely nothing unethical or illegal in doing this (about 1982). I used a 'legal' mailing address, any letters to me at the Washington State address would have been forwarded to me in Mass. and the application reflected the actual physical location of the station. The FCC requires the information so that they can correspond with you (a 'legal' mailing address) and so that they can locate your primary operating location. Both of which were provided. The rules (at that time) said that callsigns would be issued based on mailing address, so I took advantage of the rule. Of course, as soon as I got the callsign, I sent in a change of address application to reflect a "quicker" legal mailing address.

I read the rules closely at the time and found no prohibition to my approach.

Now, if you really want to have access to more 1x2s 2x1s and 1x3s --- just issue each new licensee a 2x3 and have dialup (modem) system where the licensee can do an online search for a call of preference, enter his/her current Callsign (which they would keep), and a credit card number (w/PIN ?) and a secondary, tertiary, etc. Callsign would be issued.

$250.00 / for a 1x2 or 2x1
$125.00 / for a 2x2 or 1x3
$ 50.00 / for and additional 2x3

One time cost. ($10.00 to renew every 10 years, primary license would still be free for renewal). Callsigns could be bequested (when SK) to another licensed ham or club for a $50.00 administrative fee. Abandoned Calls (non-renewed, 1 year grace) and currently unused calls would be cycled back into the system. When 1st implemented, a one year period should be given for previous owners of a callsigns lost through upgrade,

move, lapse in license renewal, etc. to file for former callsigns under the above schedule.

How about IROG-B it is old, it may not work all over the world, but it used
to be NASAs chief way of syncronizing their test results. After that,
I do not know much more about it. you could also use LORAN, but again,
it does not work all over the world. As far as Xtals go, it is ok, but
they will drift with time, and nothing can be as accurate as the
Cesium clocks at WWV/GPS/OMEGA/??LORAN?? . (while not quite nothing but close).

The HP 10811d/e is also an interesting choice, but it lacks what you
want. Hope this helps.

Harland prints my checks too, and there is no date printed that shows when I opened my account. I think it depends on if the bank tells the check printers to put it on the check.

My bank asked me what number I wanted to start with too! (I started at 500.)

Carl,
I would highly reccomend that you read the Sept. Issue of QST as it
has an excellent article on how to work the "Easy Sats". Using the info
I that I read there I worked RS-10 using my 5 watt 2 meter HT to a J-pole
and keyed it using a straight key. I then heard my CW come back down very
loud and chirpy on 10 meters. That was really exciting for me! You can work
the AO-21 with 5 watts on a 440 uplink. The article in QST has all the freq's
you will need. Good luck and catch you on the easy Sats!

73!

Jeff

2973. Finally!!! History of the word "HAM"

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-22 01:15:39 UTC
From: endelman@wellworld.Eng.Sun.COM
Message-ID: <lbsstrlNNd2j@exodus.Eng.Sun.COM>
Source record: 285053

An old QST article I remember reading related that "ham" was a slang
term used in landline telegraphy. It refered to an inexperienced
telegraph operator. An alternate term used was "plug".

I don't know, but it sounds like "ham" was short for "ham-fisted",
i.e., a mite clumsy with a telegraph key.

(really interesting home brew stuff deleted...)

If there is commercial antenna interest, Email me and I'll see what
my Tessco catalog has in it. (It's at work, and I'm home right now.

I use 900 meg Motorloa Darcoms at work for telemetry. I've been toying
with moving a couple to the amateur segment to experiment with.
I just have to figure out how to burn new proms for them. (They are
16 pin DIPs.)

The way I see it, there is nothing "illegal" about this except that if the
FCC tries to contact you via whatever mailing address they have, then you
better be able to respond within the required time limit. I am sure that the
FCC would get rather upset if their mail to you got returned "ADDRESS UNKNOWN".

I am sure that sooner or later the whole callsign system will be revised...
It may take a few more years.... but someday....

2984. Anyone Have Information Regarding Motorola VOX for HT220s?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-22 13:35:33 UTC
From: mgknn@cbnewsk.cb.att.com
Message-ID: <1992Sep22.133533.24274@cbnewsk.cb.att.com>
Source record: 285066

I picked up a Motorola HT-220 slim line HT that has what was described to me a VOX board in it for hands free operation. I am looking for ANY information, schematics or operating instructions for the VOX section of this radio. If you have ANY information regarding the VOX feature (Microphone, speaker, gain adjust etc.) I would appreciate hearing from you. Thank you.

There's an article in this months 73 Magazine where a guy worked AO_21
using an Alinco DJ-580 HT! You might need a good antenna to work it
reliably, but you probably don't need a whole lot of ERP...

To find out more about the different birds, join AMSAT, a continuing
series of articles in the AMSAT Journal is talking about the various
birds up there, and they have other references such as the Satellite
Experimenters Journal(?) that give you tips on building an earth
station.

I don't think it relates AT ALL. First off, the Ham involved was is Australia - Different rules and all that (no I don't know what they are, but I doubt that you know either, but for sure not subject to U.Su. rules in any case. Secondly, no 'business' activity took place, simply a notification of why normal communications was inoperative...which would probably fall under the 'emergency' communications rules anyway. Thirdly..... Oh why bother...

>Ya gotta feel sorry for UHF connectors. Recent strings on this notes
>group lambasted them as worthless at VHF and above, and barely
>tolerable at HF. One poster called them "5 dB attenuators", and
>many agreed that there must be some sort of conspiracy among ham
>equipment manufacturers to inflict such garbage connectors on the
>amateur community.
hmmmm What always "impressed" me was the entry in the Amphenol Catalog.
(OK, an older catalog, but so's the UHF Connector...).

Under "Impedance", where the others listed a number and a frequency range, the UHF Connector simply said "non constant".

>Today I finally remembered to bring some UHF adapters from home so
>I could do some relative measurements of UHF versus type-N.
>As expected, the type-N showed lower insertion loss at high
>frequencies, but the UHF connectors were hardly "5 dB attenuators."

>For the test I connected an HP8753 RF network analyzer through
>two short BNC cables into the following arrangement:
> _______ ____________ ___________ ____________ _______
> | | | BNC female | | N female- | | N male to | | |
>__| 10 dB |__| to N male |__| N female |__| BNC female |__| 10 dB |__
> | Atten.| | adapter | | adapter | | adapter | | Atten.|
> |_______| |____________| |___________| |____________| |_______|
>
>Then I repeated the measurement with the N adapters replaced with UHF.
>I normalized the measurements by replacing the 3 adapters with a BNC
>double-female. (That is, this was assumed to have 0 dB loss.)

Which will, i think tend to mask the effect of the impedance irregularities in the UHF connectors themselves. Also, while test data is beter than any amount of opinion, it only applies to the particular connector in question, of the particular manufacturer, and (for connectors on cable) the particular assembler error (if any).
(I get to say that, having botched my share of connectors...)

(Most excellent data deleted.)

Thanks for the tips Zack, I'll check out the paper. I have the older
Central States papers, but not 1991. As to why I want a preamp for
1269, I like to be able to receive on the frequencies that I use
for transmission. I'm funny that way.

BTW, what do you think of using power gasfets for VHF preamps? I
saw a paper in one of the Central States books describing some
experiments. Looked interesting.

2990. Re: Omni Antennas for 902-928 MHz

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-22 14:44:18 UTC
From: glenne@hpnmdla.sr.hp.com
Message-ID: <14570495@hpnmdla.sr.hp.com>
Source record: 284987

If you are looking for vertical polarization, there are many Japanese 903 antennas (left over from the Japanese Personal Radio band heydey?) which work.

N6rce and I got one, an NHG (I *think* that was it), for our 904 MHz higher speed digital networking project. This antennas appears likely to be the same as a "Diamond" offering. It is a vertical colinear array about 7' long and claiming some ridiculous amount of gain for its length, 16 dBi as I remember. It measured a little over 10 dBi which seemed about right for its size. I think they are about US $100 at present and are distributed by someone in Southern CA..

Performance appears satisfactory but as with any high gain array, it is important to mount it well and keep the nearfield clear of clutter. It was pretty easy to lose 2-3 dB during testing by just be letting things wobble around on the mount. The pattern must be reasonably well "pancake" shaped. I suspect that the directivity exceeds the gain by a fair amount. Probably the result of significant losses in the internal transmission lines that make up the antenna.

If you are interested in a yagi array, I also have a copper water pipe/brazing rod design derived from the NBS work done many years ago and reported by Joe Reisert, w1jr, in Ham Radio Magazine. This antenna, which we have now built quite a few copies of by several different individuals, performs very well and as expected. It produces about 15 dBi forward gain for a 55" boom length. Of course, it is not omnidirectional in either plane.

2993. Batteries on concrete

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-22 14:53:41 UTC
From: Mahan_Stephen@lanmail.ncsc.navy.MIL
Message-ID: <9209221449.AA00579@lanmail.NCSC.NAVY.MIL>
Source record: 284982

Ok, another theory. Since the concrete is colder than the surrounding air, there is some heat transfer from the battery case to the concrete. Now, with a cold case, there will be some condensation of atmospheric moisture onto the case, increasing the conductivity of the residual gunk which has accumulated there. Increased conductivity => increased leakage current, and a faster self discharge.

Second theory: the impact of setting the battery on the concrete jars loose some of the accumulated lead oxide on the plates thereby permanently reducing the capacity of the battery.

Third theory: There are mystical gremlins that live in concrete and live by sucking electrical energy from lead-acid batteries that someone foolishly sets on that concrete :-).

>transmit/receive ANY data, or just a limited-contents QSO?

Well, not any data but any mixture of words in a language you know
well.
That means - combination of letters that form to words that you know
and you know their meaning.

In other words, you wouldn't be able to understand high speed CW
sent in a foreign language you don't know at all.

Our high speed QSOs are not really "limited-contents",
we do really talk about everything laws permit us to talk about!

>

Someone mentioned getting a "7" call while in the Air Force in (I think) Massachusetts. One of the few "advantages" (if you could call it that) of military service is that other government agencies, at all levels, frecognize the transient nature of the service. Therefore, you can use either your residence address, your home-of-record address, or fudge another one without worry. Taxing authorities, though, do look closely at your address claim.

> then I have to translate.

Do you have a recent version of Super Morse? If so, which features
are you using?

You might want to consider trying the "Random Lag" feature. I've been
using it to try to improve my "head copying" skills (as opposed to writing
down the letters). In this feature, the program gives you 3 letters/numbers/
symbols, and then randomly asks you to type in the 1st, 2nd, or 3rd one
in the group. I'm not sure how useful it is, but it breaks up the
monotony for me of practicing. :-)

I've also been using the feature that generates random words. Friends
of mine who are very good at CW have suggested to me that I try to just
listen and pick out words, instead of just transcribing every letter as I
hear it. Since I respect their skills, I figured I'd give that a try, too.
I seem to be recognizing more words as I practice, but this brings up
another problem -- anticipating what I'm going to hear next (if I'm wrong,
I often just miss the whole rest of the word!) Likewise, I've been trying
to listen to a QSO without writing down everything, just to try to get
comfortable (hahahahahaha) with the code.

I'm not sure how well this will work for me; guess I won't know unless/
until I go for the 20 WPM exam! :-)

From: tonyp@convex.com
Message-ID: <1992Sep22.180038.16741@convex.com>
Source record: 284984

I've lived in an apartment for the past 8 years and all my antenna books are packed away.

With a little luck I will be closing escrow on a place with a little bit of land.

I can't afford the 4-element 5-band quad & tower that I want.

But - wire is pretty cheap.

Rhombics:

o Performance factor of a rhombic over a quad.

o I have a 1700' perimeter. What band will "fit"?

o Am I better off using the 1700' (maximum length wire) or cutting it to a resonate length?

o Will it work better on "other bands" (because of the length of wire) than a tuned dipole cut for the "specific bands"?

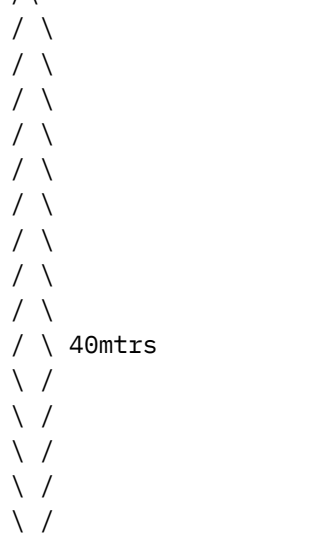
o The house is in the Southern corner (so is the feedpoint). Does this mean it will radiate North?

o It "is" fed from a corner, and not the middle of a leg, correct?

o Do you feed it with RG58 or 300 ohm line?

o Can you do the following to get more bands?

[Assume picture is a square, and not a kite] :-)



Thanx for any help.

73,
tonyp

Reminds me of a trick used at FM broadcast transmitters to attenuate
(even, I believe) harmonics: the center conductor of a length of
6" diameter coax is replaced with a piece which alternates between
large and small diameters (<50 ohms and >50 ohms). The result is
a match at operating frequency and reflection of (even?) harmonics.
(I'm pretty sure it's _not_ all 1/4 wave sections at operating freq to
accomplish this! Get out some Smith chart paper and have at it...)

Not exactly. There seems to be some conflicting information here. In
the first paragraph you said that you can get credit for working
Germany only once. Later, you said that East and West Germany counted
as two separate DXCC countries and that East Germany only counted from
1973 to 1990. I have cards from East and West Germany during that
period. Won't they count as two countries?

3003. Help Me Determine Value of...

Date: 1992-09-22 18:53:53 UTC
From: bsplaine@mtmtl8.sr.hp.com
Message-ID: <23860013@mtmtl8.sr.hp.com>
Source record: 284957

I need help in determining the value of the following pieces of gear......

1. Yaesu FT-401B with accessory VFO, microphone and a 10-40M vertical.
All gear has manuals and orig shipping boxes (whatever that's worth).

2. Homebrew KW that uses pair 572B's and comes with about 6 or 8 spares.

3. Navy Receiver (boatanchor?) Model CMX 46159

Any help would be appreciated. AND if any of this interests you, please
let me know. The Yaesu works FB and is a 250 watt in Xcvr. I have never
used the KW but was told it worked fine by the wife of the previous owner,
now a silent key. The Navy receiver is far from mint but not bad in looks.
Have no idea if it works or not.

Bill, N6GHG

I maintain a database of all the hams in Sonoma County. Recently, I was
updating it by comparison with the FCC data. You would be amazed at
the number of hams who move without bothering to tell the FCC about it.

It's like driving without a license. As long as you don't get stopped,
you have nothing to worry about.

I don't have a circuit, but I do have a story. A friend back in Ohio had built a vacuum-tube Tesla coil as a lad. He used a PAIR of 813 vacuum tubes running about 1000 watts at a few 10's of kHz. He claimed he got a ball of fire about 5 feet in diameter. He had heard that, because of skin effect, you could touch the radiator without getting hurt, but he was understandably reluctant to test it himself.

So he tied his cat up with a beach towel and lowered it into the ball of fire with a broomstick. The cat became somewhat agitated :=))

3006. Looking for surplus 70cm radios for 9600

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-22 19:59:59 UTC
From: mleech@bnr.ca
Message-ID: <1992Sep22.195959.21301@bcars6a8.bnr.ca>
Source record: 284988

The packet working group of the O.A.R.C. (we brought you the PI card) is looking for a couple or three surplus radios for 70cm.

We're looking for 30-50W out, IF bandwidth suitable for 9600 FSK data.

We've scoured the local area basements, etc, and found no suitable surplus radios for use on 440MHZ for 9600 data.

Radios that are operational are preferred over handymans specials. That is, we are willing to do the work needed to interface modems, but we aren't willing to turn rusting boat anchors back into radios first :-)

So anyone with any surplus commercial gear gathering fungi in their basements drop me a line!!!

>FCC would get rather upset if their mail to you got returned "ADDRESS
>UNKNOWN".
>
>I am sure that sooner or later the whole callsign system will be revised...
>It may take a few more years.... but someday....

a few years ago now, i was involved in a project to convey examination
information to the area novices. we were able to get a mailing list, set
up the word processor to merge the names and addresses with the standard
blah about when and where the exams were and a bit of pep talk about why
you should consider upgrading. All sent first class mail = about 300 total.

we got back something like 15 to 20 percent as undeliverable (well, ok, 1 guy
had died in a car wreck or something) and it appeared that many of these folks
never bothered (or realized they were supposed to) update the FCC with their
new addresses. was quite a surprize to get back about 60 of the 300 letters
we sent out with those yellow "undeliverable" stickers on them.

checked them the next year against the buckmaster CD rom and found that a few
(5 or 10) had filed new addresses, another 2 or 3 were silent keys but
the majority of the 60 were still listed at the same address as before.

i'll have to check my copy of "now you're talking" tonight to see if there is
anything in there about the "food chain" (correct FCC data benefits the people
trying to QSL you, for example).

i guess we should be glad the FCC isn't checking up...

-=-

and I still want "Ren and Stimpy" Amateur Radio Radio PSAs. or Stan Freburg.
and it's time for some new comic books - Archie is a bit long in the tooth
these days. right now, i don't know if even R&S may be too late and we've
missed Teenage Mutant Ninja Turtles (and they would have been a natural fit).
What's hot right now? I don't see anything on the horizon yet...maybe a tie
with Disney's "Aladdin" coming up this Christmas?

Ren: "Keep your feelthy mits OFF that RADIO until YOUR LICENSE arrives!"

Stimpy: "(in code) NN MA NN MA..."
Ren: "(head coming through speaker) Do You HAVE TO KEEP *TAPPING* LIKE
THAT!?...You BLOATED SACK of PROTOPLASM!"

just thinking of a Sta-Put (tm) ham rig throttles the imagination! the perfect match for the Sta-Put Socks, Hat and Coat.

need a "toastromitron communicator" made from the old Toastmaster...for hams that need to call Powdered Toast Man!! when they have a flat on the interstate. (there's at least an april QST article...)

and why don't we put a "Want to get a license for a real radio station?" postcard in all those 49 MHz walkie-talkies? let the end user supply the stamp even. GE had a set that even talked about Morse (Morris for Macassey) in a *Positive* light! would assume that the card would go to NARA or ARRL and the response would be the infamous Prospective Ham Package in return along with a tickler to the local class teachers or radio clubs.

Message-ID: <1992Sep22.215334.25813@news.columbia.edu>
Source record: 284991

hi,

having made a few antennas recently, I realize that I should get a swr meter. also, playing with various power supplies and batteries, I think that a power meter would come in handy also.

I know about the MFJ-841 that has bnc connectors, the radio shack 2m/70cm swr/power meter that has a pl-239 connector, and the daiwa products.

anybody have opinions about these?

I have a dual band HT (Alinco DJ580T), and the bnc's would be simpler.

thanx

john

3012. TS-930S on RTTY help needed.

additional deleted for time and space

Because I don't have a proper ticket for HF ops (and only recently passed exams for Tech no-code), I can tell you only what I've experienced as a receiver.

My computer is a VERY noisy Commodore 64 (two others, but the 64 has the Pakratt installed) operating at a blazing 1MHz. Video output is NTSC standard with a 60Hz refresh (picture TV). Using a dept. store shortwave receiver, possibly to tune in RTTY, AMTOR, CW, et al, the included 4 1/2 foot whip does a satisfactory job (with the computer off). Trying to decode these signals means turning on my lightening-fast turtle, only to be baraged by noise across all the bands (FM excluded). My first fix was to enclose the radio in a steel box and ground the box. This did well, but I couldn't tune the radio or listen without opening the box.

The next option was to use ladder-line off the radio's external antenna posts, up to a long-wire draped over the house. That served to improve my signal-to-noise ration considerably, but I still heard the computer.

Finally, I grounded one side of the ladder-line at the radio (per manual), and lost ALL computer noise. As was previously stated, RFI/EMI only occurs on HF; I get no noise on 2m and up.

I might suggest that ferrite beads be placed on some computer cables (such as keyboard and monitor), and/or shield these cables to ground. The ground can and should be the same as the radio to keep ground-followed emissions away.

I might also suggest placing ferrite beads on the TNC-radio cable. Loop the cable once on the bead, making a sort-of torridal inductor.

I might suggest those, but I can't because I have no experience with computer-to-radio interference, especially during transmit. But, you might try placing several band-pass filters on your transmitter, selectable with your band tuner (7MHZ filter for 40m, 14MHZ filter for 20m, etc.).

```
* (3) - is there any optimum length/width ratio for the primary and secondary
* coils?

When designing RF inductors for the VHF/UHF range the Q is optimized when
the length is about 1.5 to 2 times the diameter, and the space between
windings is about 1/2 of the wire diameter, wire should be FAT. Not sure
how this would relate to a tesla coil.

* (4) - what kind of voltage does it require to break down 14" of air ?

From the Handbook of Chemistry and Physics: A 35.7cm gap (14.1") with
needle point electrodes requires 200,000 volts. The ratio of the voltage
to spark gap has a curve to it for "low" voltages, but beyond 100,000
volts it is very linear: gap in inches = .074 * Kilovolts - .7
The data in the Handbook goes up to 300 KV with a 21.5 inch gap.
If the electrodes are not needles the voltage required goes up considerably.

It sounds as if you are arcing from an electrode into free space. So
this data doesn't apply directly, but it gives you some idea. You might
try setting up a ground electrode so that you have a gap you can measure
as an experiment. Also what is your electrode at the top of the coil?
Try a bunch of wires sticking out with lots of sharp points.

I'd say it was probably the first emergency communication from a
spacecraft using amateur radio - thus no legal problem. Also, the
shuttle is a government and research activity - it would be hard to
classify it as a business.

3017. TVI dilemma update

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-23 01:05:09 UTC
From: endelman@wellworld.Eng.Sun.COM
Message-ID: <lbvgm5INN2fv@exodus.Eng.Sun.COM>
Source record: 284998

Thanks to the many hams who responded. Most were good suggestions, but a few, who shall go nameless, were absolutely sure they knew what was wrong, and what should be done to fix it, all without testing anything! Pardon my getting on my soapbox for a second, but thoughtful reasoning and experimentation usually go a lot farther in solving problems than know-it-all arrogance.

Back to the matter at hand:

To review, initially, all TV channels were getting overloaded by my 100W HF transceiver, with a dipole 50' away from the TV antenna.

I'd added a high-pass and common-mode filter to the TV input, a common-mode choke and bypass capacitors to the AC power line, and a low-pass filter to the transmitter. Only the high-pass filter had a significant effect, but I'm still getting strong interference on channel 2, weaker on 4, almost gone by 5, nothing thereafter.

I have a second TV that experiences identical symptoms, so I can almost certainly rule out deficiencies in a particular TV.

Several hams mentioned the possibility of corrosion rectification producing harmonics, and I'll especially thank WT6G who suggested substituting an indoor antenna for the outdoor one. I ran down to the local Radio Shack and picked up an $8.95 pair of bunny ears and found that there was no change in the interference symptoms!

All of this strongly suggests corrosion rectification. There's a rusty rain gutter near the dipole that's a prime candidate. Time to get out the trusty grid-dip oscillator (to be used passively, as an absorption wavemeter). I'll post the results of that search.

N5OP also suggested that the TV balun might be saturating, producing harmonics; I moved the filters from after to before the balun, but again, no change.

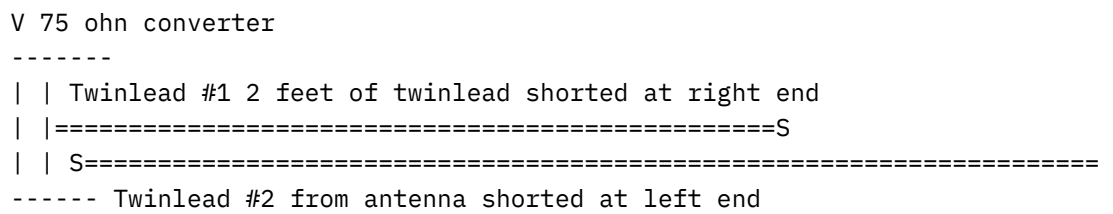
Finally, I thought I'd pass on this idea for a super-cheap high-pass filter, courtesy K0GU:

==========

Hi Aaron,
Here are the details on the worlds cheapest and most effective highpass filter (sounds impressive huh?). Connect only 2 feet of twinlead to your 75 ohm converter at your TV set. Short the end of the 2 foot twinlead that isn't connected to the TV. Now short out the end of the twinlead coming down from the antenna. Lay the twinlead from the antenna flat on top of the

2 feet of twinlead to the TV and tape them together. The VHF TV signals
will couple to the TV via the 2 foot shorted twinlead, the 20 meter signal
will be shorted out. Hope this makes sense.

73, Jay K0GU jayk@hpxxx.fc.hp.com



S= short here

Tape the two pieces of twinlead together along the 2 foot lenght.
The two pieces should be lying flat, and on top of each other.
The TV signal is coupled between the the wires in the 2 pieces of twinlead.
The actual wire in twinlead #1 a does not touch the wire in
twinlead #2.

If you are in a fringe reception area for channel 2 it may be required
to lenghten twinlead #1 a little to not degrade the signal of channel 2.
If you have strong reception on channel 2 you can shorten twinlead #1
a bit and even improve the filter effect.

No, just us net control freaks. :-)

I wouldn't mind co-moderating a bulletin and FAQ-oriented newsgroup such as rec.radio.announce or rec.radio.info (similar in setup and function to news.answers). Naturally, this would have to be acceptable to a majority of the net (I have my detractors) and I would prefer if it rotated among several guest editors (such as with alt.comp.acad-freedom.news).

Any other volunteers?

3020. radio mods for aircraft nav beacons?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-23 04:04:23 UTC
From: jtg0707@uxa.cso.uiuc.edu
Message-ID: <Bv0JBB.43v@news.cso.uiuc.edu>
Source record: 285003

I am new at the 2m radio. I am interested in hearing from anyone who has experience modifying 2m rigs for AM aircraft transmissions. I am licensed pilot who needs a reliable backup radio to the regular
regular onboard comm/nav radios. I looked at the regular aircraft xcvrs such as the icom-21a. They tend to be too bulky and too expensive.
Are the mods converting 2m rigs to true AM ?
For your information, the TWEB broadcast on nav beacons have a range of
about 25 to 40 nautical miles depending on altitude.
Any info will be appreciated.

-WHAT????!!??? NASA doesn't have a backup to TDRS???? What insanity!!!
-Any communications system that is MISSION ESSENTIAL has to have full
-backup. Or have MBAs and yuppies taken over NASA to the point where
-the bottom line is omnipotent even at the cost of accomplishing the mission?

Well, before TDRS there was no communication for much of the orbit.
Communications only existed when the shuttle was within sight of an
earth station. Those missions went successfully.

A big rhombic or Vee beam will knock the socks off a quad, of course,
it won't be rotatable.

> o I have a 1700' perimeter. What band will "fit"?

A rhombic as small as 4 wavelengths gives good gain, larger, up to
8 wavelengths is better. Beyond 8 wavelengths, you get diminishing
returns. Your lot is big enough for all bands.

> o Am I better off using the 1700' (maximum length wire) or
> cutting it to a resonate length?

Yes, use as much length as possible.

> o Will it work better on "other bands" (because of the length of
> wire) than a tuned dipole cut for the "specific bands"?

Yes.

> o The house is in the Southern corner (so is the feedpoint).
> Does this mean it will radiate North?

A terminated rhombic is uni-directional while an unterminated
rhombic is bi-directional. You can also change the phasing at
the feedpoint to get broadside gain. Normally you feed the antenna
differentially with a 180 degree phase shift between the legs, but
you can make a switching arrangement to feed the legs in phase to
get a semi-broadside effect. The gain will be less and minor lobes
will be everywhere, but it performs ok.

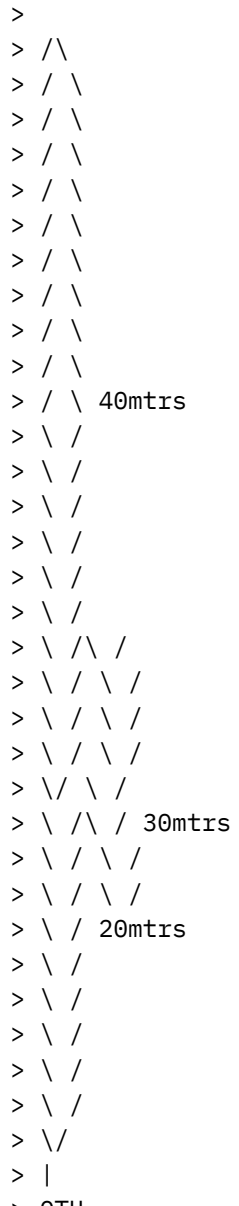
> o It "is" fed from a corner, and not the middle of a leg, correct?

That's correct.

> o Do you feed it with RG58 or 300 ohm line?

600 ohm ladder line is best, but any open wire balanced line will do.

> o Can you do the following to get more bands?
>
> [Assume picture is a square, and not a kite] :-)
>
>



This is not a good idea. Once the antenna reaches about 8 wavelengths,
the absolute length becomes unimportant and resonance is not an issue.
That's because most of the energy will have radiated before reaching
the further end. Also, and this is important, the included angle at
the feed point and the far point should *not* be 90 degrees. You *do*
want it to be a diamond and not a square. For an 8 wavelength rhombic,
the included angle should be about 36 degrees. A 4 wavelength design
needs to be about 45 degrees. And a 10 wavelength design needs to be
about 32 degrees. Now obviously there's going to be a compromise
on different bands, but a 90 degree included angle isn't going to ever
be right. You'll wind up with an *omni* antenna called the square loop.
That's ok, it has great capture area, but it's not a directional antenna
with a predictable pattern.

Cross-posted to: rec.bicycles,rec.radio.amateur.misc

Anyone going to the Rosarito-Ensenada ride this coming weekend (Sep 26) know who, if anyone, is doing amateur radio support for the ride. Callsign, Name, Phone #?

Any update on the USA - Mexico negotiations for automatic reciprocal amateur radio licensing? Last I heard, an agreement was being negotiated, similar to what's in place between USA and Canada - Hams from either country can operate in the other with no special permit. Last I saw here on a US ham getting a XE2 callsign was a procedure that took a few hours in Tijuana - not possible if you're passing through late on Friday night...

Thanks...
geoff

>Germany only once. Later, you said that East and West Germany counted
>as two separate DXCC countries and that East Germany only counted from
>1973 to 1990. I have cards from East and West Germany during that
>period. Won't they count as two countries?
>
To get credit for DXCC, only ACTIVE countries may be counted.
For an application for the DXCC award prior to October 1990, you could
claim credit for both parts of Germany. If you apply now, you MUST NOT
even use a card from East Germany from the period 1973 to 1990 for your
application because you would be using a card from a deleted country
which would consequently not be accepted.

Currently, there are 323 active DXCC countries. Latest changes were in
1990 when, hardly noticed by the public, both parts of Yemen united
(and South Yemen became a deleted country) and due to the German
re-unification.

New changes are imminent. With of former Yugoslavia having fallen apart
(and being dismissed from the UN yesterday), YU with all its former
republic will become a deleted country. To get credit for the new
countries which formed out of Yugoslavia only after having worked them
ANEW from the day on they will be recognized for DXCC. This means,
you can't take your old YU2 card from, say, 1989 and claim credit
for the new DXCC country Croatia just because that station was located
in the Yugoslav republic of Croatia (Yugoslavia was a federal republic).

It's a bit silly, isn't it, but that just the way things are, and that's also ONE reason why I personally, after many years of desperately trying to track down those very last 'countries' (consisting of a couple of rocks constantly being washed away by the sea and being held in place only by means of armored concrete), decided to abandon the rules and set up my own personal little rules. IMHO today's DXCC rules are not adequate anymore, but that's just another issue.

Finally, here's a listing of those countries that already replaced former Yugoslavia and will eventually become recognized as DXCC countries:

Name of Country	former or current prefix	new prefix
Serbia-Montenegro	YU1,6,7, 4N1,6,7	?
Croatia	YU2, 4N2	9A
Slovenia	YU3, 4N3	S5 (as of Oct.92)
Bosnia-Hercegovina	YU4, 4N4	?
Macedonia	YU5, 4N5	?

This brings to my mind that the next deleted country (as of Jan 1st, 1993) will be Czechoslovakia (now OK) which will be split into two parts: a Czech republic (no decision on the official name so far) consisting of Bohemia and Moravia (now OK1 and OK2) and Slovakia (the Eastern part, currently OK3).

Well, now that the confusion is complete, I'll better stop and return to the work I'm being paid before because otherwise I would be tempted to develop my own ideas on DXCC here (see above)...

73 & happy hunting,
Wolf.

Gee, Bob. That doesn't seem very friendly. I can recall just a few months ago
that you were boasting all over these groups about having been solely responsible
for the code and wanted to answer everybodies and anybodies questions about DSP's
and their relationship to ham radio. Obviously, something has gone sour... Too
bad, as situations like this are only going to slow the wider spread use of DSP
devices, if too many people believe that they drive people to these extreme mental
states... Good luck in your recovery.

A post-college roommate make an impressive coil in high school (Vienna, VA, early 70's). While looking for a neon-sign transformer he found 10KV at 1 (one) amp as a piece of government surplus -- we figure it was used to drive a bank of radar displays. He got his HS electronics teacher (a retreaded auto shop teacher) to sign for it -- the seller was afraid of someone getting killed.

The rest was fairly stock, down to the copper sheet primary. The secondary was a long Lucite bar. "We couldn't "slop" the slop-winds enough -- each turn kept arcing over!". He figures they broke a megavolt and were pulling huge sparks with it. It made such a huge racket the one time it was powered up that the principal came running into the classroom and shouted, over the din, that it be destroyed at once and never reconstructed. No idea whatever became of the transformer. Good move on the principal's part. Glad no one killed themselves.

3037. Tesla Coils

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-23 15:08:16 UTC
From: Hugh_E._Wells.El_Segundo@xerox.COM
Message-ID: <"23-Sep-92..8:06:10.PDT".*.Hugh_E._Wells.El_Segundo@Xerox.com>
Source record: 284906

Tesla coils are very interesting devices and I've built a number of them over the years. Most of mine were built using vacuum tube exciters, although I've designed several using a neon transformer. Friends have built Tesla coils using my neon transformer design and have had satisfactory results. The tubed Tesla coils are not nearly as impressive because of the lower power (which could be remedied with high power transmitting tubes.

The one factor I've observed is that the primary coil wire diameter must be large to accommodate the high primary current value. The coil Q factor and resonance with the secondary are equally important. Most tubed Tesla's I've worked with have operated about 1mhz and did a fine job on the broadcast band.

In answer to the question about the voltage to breakdown air, I can't remember the exact value, but believe it to be 100KV per inch.

If the operating frequency is above say 1mhz, the RF energy will be distributed on the surface of a conductor (human body or whatever). As an example, a person standing on a well insulated platform of HV insulators can have their hand on the ball of the Tesla coil without any major ill effects when all factors are considered. The caution here is: As the generated voltage rises to the very high values, say 140KV, the sparks emited from one's finger tips, ears, nose and other fairly sharp points will cause excessive burns down to the bones. Holding a pointed metal object in the free hand tends to concentrate the discharge to the metal point reducing the risk. I observed a young lady with her hand on a Tesla coil during my early years. This lady had very dry hair which stood out nearly straight from her head as if teased.

Suggestion: Don't play games with a Tesla coil. At most, use a fluorescent lamp to show the lighting effects at some distance from the coil. Or, put pin wheels of various shapes on the top and observe the action. Don't risk a human by touching the coil when it is excited.

Best regards,
Hugh Wells, W6WTU

> I work in the communications Industry,

Chris,
I must comment, I have worked in communications industry also, last 20 years, spent 2 years working at a motorola shop as a portable and pager technician, most radius radios today are an excellent buy, if they are bought new, they have a "3" year complete warranty, not covering abuse or batteries. (batteries are covered for 1.5 years)
Also most radius radios are direct copies of standard Motorola radios, for instance the P-200 is the same as the HT-600. etc.
I have found for the most part that they are very durable and dependable.
"I am not connected in any way to Motorola or Radius, the above is my own opinion "

Gary, could you explain this a little better? I interpret feeding both legs
in phase as simply twisting the two feedline wires together making a rather
long random wire out of the whole thing. Or did you really mean antenna
legs, not feedline legs? Are you talking about a feedline at one end of
the rhombic and another at the other end or sides?

Source record: 285026

> I'm interested in how to get started,
> what equipment costs, what licensing is needed, etc

There are 5 classes of license, with an ascending scale of difficulty.
The higher the license class, the more operating privileges you
get (frequencies and modes). All licenses but one require you
to pass a test in receiving Morse code. There are generally two kinds of
ham operations: local and long distance (DX). Local operations
take place mostly on VHF and UHF frequencies using Frequency
Modulation (FM) voice. Mobile (car) installations and hand-held
(walkie-talkie) operation are both popular. DX operation takes
place mostly on the High Frequency (HF) bands using single sideband
voice, and morse code. Even a simple station will allow you to
make contacts with other hams anywhere in the world, given
favorable conditions. A basic HF ham station can be put on the air
for less than $500 if you buy used equipment. If you want new gear,
figure on $1000 - $1500 minimum. You can spend a lot more than
that if you want, but it's not necessary. A good first step is to buy
the book "Now You're Talking". It describes ham radio, and tells you
all you need to know to get the entry-level license. You can get the
book from your local ham store, or from the American Radio Relay
League, 225 Main St., Newington, CT 06111. The League can also
put you in touch with ham radio clubs in your area that can help you
get your license. Good luck...

3044. DXCC and Germany, from _ARRL DXCC Countries List_

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-23 17:22:49 UTC
From: reisert@sttng.mlo.dec.com
Message-ID: <1992Sep23.172249.25292@nntpd.lkg.dec.com>
Source record: 284883

There are 3 Germany counters on the ARRL DXCC list, one on the current list (which is the only one that counts towards Honor Roll), and two on the deleted list. They are:

DA-DL,Y2-Y9 Federal Republic of Germany

"Only contacts made with DA-DL stations September 17, 1973, and after, and contacts made with Y2-Y9 stations October 30, 1990 and after, count for this country."

Now on to the deleted ones:

DA-DM Germany

"Only contacts made September 16, 1973, and before, count for this country. Contacts made September 17, 1973, and after, count as either FRG (DA-DL) or GDR (Y2-Y9)."

DM, Y2-9 German Democratic Republic

"Only contacts made from September 17, 1973 and [sic] October 2, 1990 count for this country. On October 3, 1990 the GDR became part of the FRG." (this should really say, "...made September 17, 1973 to October 2, 1990...")

So there it is in black and white (depending on the color of your terminal/monitor, of course ;-)

Um, begging the Colonel's pardon, but this is way off base. Just because
Bob was nice enough to give us a window in on some commercial code he was
writing for a product that would interest most of us here, doesn't obligate
him to providing full free support of said software over the net. Especially
when the commercial relationship ends.

Thanks for the info. The thing that always bothers me about
PL259/SO239 connectors is not how good the adapters to other
connector families are, but what the results are with a
soldered connector. This is the main reason I loath PL259s.
I'm sure that under ideal conditions they're acceptable to
UHF, but I wonder how the average home-constructed connector
will perform ? N-types seem to be much more usable.

3049. Yaesu FT-736R oddity

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-23 18:03:55 UTC
From: obrien@Aero.org
Message-ID: <19qbibINNi3@news.aero.org>
Source record: 284879

Having seen the debate about satellite rigs, I thought I'd throw in
something I discovered last night about the Yaesu FT-736R, having
recently acquired one.

The rig I bought came with a 6-meter module which I had no intention of
using (if it doesn't move at the TRW Swap Meet this Saturday, make me
an offer). So, when I opened the radio to install the 1.2GHz module,
I yanked the 6-meter module. So far, so good.

However, I had never used one of the two satellite VFOs. It happened
to initialize to 50.000 on one of its two bands. Now, whenever I
access that half of that VFO, the entire radio locks up and "Error"
appears on the console.

The instructions do not mention that a microprocessor reset might be
necessary, but then, the instructions cover putting a module in, not
taking one out. What's frustrating about this is that if I could just
overwrite the stupid VFO the problem would go away, but there's no way
to do this. There is no button on a 736R to do a MEM->VFO transfer.
There's "exchange MEM and VFO", which moves the baddie to a memory, where,
as it happens, it refuses to allow itself to be overwritten with good
data, so that doesn't help. You can move the bad reference around but
you can't get rid of it.

So tonight I get to reset the sucker and reload aaaaaaaall the memories.
sigh

3051. Germany and DXCC (from ARRL DXCC Countries List)

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-23 18:11:00 UTC
From: reisert@mast.enet.dec.com
Message-ID: <9209231810.AA00290@enet-gw.pa.dec.com>
Source record: 284881

There are 3 Germany counters on the ARRL DXCC List. One is on the current list, and thus counts towards Honor Roll. The other two are deleted, and only count if the contact is made during the dates shown.

They are:

DA-DL, Y2-Y9 Federal Republic of Germany

"Only contacts made with DA-DL stations September 17, 1973, and after, and contacts made with Y2-Y9 stations October 30 [sic], 1990 and after, count for this country." (it should say "...October 3, 1990 and after...", see below)

Now the deleted countries:

DA-DM Germany

"Only contacts made September 16, 1973, and before, count for this country. Contacts made September 17, 1973, and after, count as either FRG (DA-DL) or GDR (Y2-Y9)."

DM, Y2-9 German Democratic Republic

"Only contacts made from September 17, 1973 and [sic] October 2, 1990 count for this country. On October 3, 1990 the GDR became part of the FRG." (it should say, "...from September 17, 1973 *to* October 2, 1990...")

So there it is, right out of the ARRL DXCC List. It's interesting that the ARRL made *two* typos in describing the changes with Germany's status.

If this is the way it is, then why did the my bank (in Ohio) ask me if I wanted my checks to start at 101 or 501? This was just last year (< "past year or two"). Unless I opened my account just before the law took effect.

Another strange point: When I asked why I would want them to start a 501, the lady told me that it might make it easier to use a check (with a higher #) at some places. Always a loop-hole!

>i guess we should be glad the FCC isn't checking up...

There used to be a rule requiring you to notify the FCC of address changes. You had only about 30 days or so to do it. Meanwhile, you had to sign your call /whatever and notify the engineer-in-charge of your portable operation. When the FCC changed these rules to simplify them, they seem to have forgotten to include the requirement to notify of the address change. I went looking through the rules to see what they say just the other day (cuz I've moved) and couldn't find a thing on this subject.

3063. Ham Radio in France

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-23 22:52:06 UTC
From: tlanders@atlastele.com
Message-ID: <1992Sep23.225206.8044@atlastele.com>
Source record: 284937

Hi. I am the one who posted asking for information about ham radio in Europe about a month ago. Well, I have since taken my no-code tech exam (and passed!). However, I will not get my license for another 7 weeks (the FCC is very behind). My problem: I was just informed that I will be going to Paris for two months on October 10th. I will not get my Ham Radio license until half-way through my trip. Question: can I legally bring my radio into France without a Ham license? Since France has a reciprocal agreement with the US, I assume that I can use it over there once I get my license, right? Thanks a lot for any info.

Nope. The headings for class have been displaced. A=Extra, B=Advanced,
C=Tech.Gen, and D=Novice. Normally, you would have been eligible for an
N5xxx call, but all of them have been issued in your area.

> cuts in half way through an over?

Nope. I monitor my work's repeater throughout the day, and I use the tone squelch as there is another system on that freq close enough to be annoying. There is about a 3/4 second hang time on the repeater (no PL), so having a tone encoded signal appear on an unencoded carrier is quite common. About the only thing I get is a syllable or two missed, but that may be an overanxious talker too quick on the PTT.

It's about time that the FCC goes and recycles the calls from the silent
keys and dropped calls. It would be great to get a W3xx call...

>legs, not feedline legs? Are you talking about a feedline at one end of
>the rhombic and another at the other end or sides?

Yes that's what I meant, break the rhombic at the corners that have the large included angles, open the far termination, and drive them with two feedlines as a pair of long zepps in phase. But my experience has been that it isn't worth the trouble to do that. With a big rhombic, the feedlines would be really long. The alternative of just shorting the feedline legs and feeding the rhombic as a "fat" longwire seems to work ok.

I used to run a rhombic that was 1000 feet from the feedpoint to the far vertex. It was oriented SW to NE. I had a switchable termination at the far end, 600 ohms 200 watts. With the termination switched in, the antenna was uni-directional to the NE. With the termination open, it was bi-directional SW/NE. By shorting the feedline and feeding it as a "fat" long wire, I had major lobes NNE and ENE with minor lobes in nearly every other direction. Used that way it was deaf only to the SW.

3069. Re: Packet uploading problem

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-24 00:31:23 UTC
From: davew@tfs.com
Message-ID: <1992Sep24.003123.26326@tfs.com>
Source record: 284901

As a Sysop, I often find that problems with "lost data" during and upload or download is due to a flow control problem at the user end.

A typical example would be a user who complains that he can upload a small file, but big files start losing data after a portion of the file is sent. That is to say the data dropout do not start at the begining of the file but towards the middle.

What is occuring is that they are overflowing the internal buffer of the TNC by sending data to the TNC faster than it can flush out the AX.25 side. With small files, the TNC buffer will hold all of the file, but a big file will fill the buffer. At that point the TNC will attempt to "pause" the computer from sending more data. This can be done by "hardware" flow control which uses some of the RS-232 lines, or software flow control which uses ^S (stop) and ^Q (start) control charactors.

As long as both TNC and computer terminal program are using the same scheme, then the computer will wait till the TNC signals it has more room to accept data into the buffer. If not, data that was sent to the TNC while the buffer was full will be lost.

As you can see, this is not a fault or problem with AX.25 packet but rather a interface problem in the user's station. But he will not know this.

BTW, I'm currently finishing up a manual on BBS Sysop procedures. I'm actually writing it for CAP packet, but it is close to ham operations. Does anyone know if there has been a how-to book published for the packet BBS Sysop?

Huh? Is this so?! Even though a country was on the list at the time I worked it, I don't receive credit for the contact unless I submit the card before the country is deleted from the list? For example, if I haven't submitted my YU and OK cards yet, then I'll lose credit for these countries if/when they are deleted? This certainly doesn't sound right to me....

Source record: 284894

I wasn't planning on any public responses here, since this isn't really an amateur radio topic, but since there seems to be a lot of interest, here's some information:

The best single source for information about Nikola Tesla, Tesla coils, and similar apparatus is:

Lindsay Publications, Inc.
P.O. Box 12
Bradley, IL 60915-0012

Lindsay's offers primarily reprints of books and other information concerning technology and techniques no longer in general use.

Recently I noticed the book "Inventions, Researches, and Writings of Nikola Tesla" by Thomas Commerford Martin at a local bookstore. Lindsay's offers this book, but the one at the store was published by someone else, so this book is currently available from two publishers. Note: this book was originally published in 1894 and deals mostly with Tesla's work with polyphase currents and his lectures and demonstrations up to that time. There is some information on his early work with "Tesla coils", but he was actually just beginning his more famous work in this area at the time. (Tesla's Colorado Springs experiments took place in 1899-1900.)

Regarding the specific questions on Tesla coil construction: There are a number of factors that need to be taken into account to get the best performance (longest sparks). One of them, the "Q", has already been mentioned. Basic rule of thumb is you want the length of the secondary coil to be 2 to 2-1/2 times the diameter. The next is a lot more tricky to work out. The length of wire used in the secondary should be equal to a quarter wavelength of the resonant frequency. This way you have a voltage maximum at the free end of the coil. From what I can tell (I've never actually built a Tesla coil due to lack of money and facilities to do the job right) this is no easy task. You have to figure out where the secondary is self-resonant, and tune the primary accordingly. Alternately, or in combination, you can tune the secondary by means of what Tesla called an "elevated capacity", those globular capacitors one often sees on the end of Tesla coil secondaries. The disadvantage of the elevated capacity is that it accumulates a charge. This should make for shorter, less continuous, less impressive discharges as opposed to a point. Also, it's quite a bit more dangerous due to the accumulated charge.

The most common alternative to the single spark gap in the primary, which offers improved performance, is the rotary spark gap. This is a set of rotating contacts to increase the number of sparks and get more energy into the system. I have heard of the vacuum tube driven primary technique

but I haven't heard of many successes using it. I'm figuring it's more difficult because the tube oscillator must be tuned to the frequency of the rest of the system, and this is usually not a known quantity until after everything has been tuned up and operating.

I hope this information is of some use, and again I apologize for taking up so much space on a (somewhat) unrelated topic. Is there a Tesla mailing list, or enough interest to start a newsgroup? :)

3074. KENWOOD TS530S TO HAMTRONICS TRANSVERTER INTERFACE

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-24 02:58:11 UTC
From: bourque@sceng.UB.COM
Message-ID: <9209240956.A31255@sceng.ub.com>
Source record: 284934

Sorry my original posting (repeated below) has caused so much confusion.
If you could only see some of the e-mail I have gotten regarding this
posting. Some of you respondents clearly don't have a clue on this matter.
Many however were very nice and helpfull. Most have clearly never done
the interface to this particular radio which is what I was looking for.

First off, the 530S does NOT have a transverter output. The 520S does but
the 530S does not. I would certainly welcome any mods that I could perform
to give 530S a transverter output.

Secondly, attenuators are easy but I was hoping to avoid building one
to pad down 100+ Watts down to ~200mW. I may not have a choice however.

Again Thanks for all the help. email bourque@sceng.ub.com

>Has anyone in Net Land successfully interfaced a 530S to one of the

3078. How do you count Germany for DXCC?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-24 11:35:58 UTC
From: WKOEHLER@ESOC.BITNET
Message-ID: <92268.113558WKOEHLER@ESOC.BITNET>
Source record: 284909

In a posting earlier this week I stated:

"For the DXCC award, you can get credit for working Germany only ONCE."

I stand corrected, thanks to Jim, AD1C; my sincere apologies to the readership. Obviously I got 5BDXCC and Honor Roll mixed up with the rest of the DXCC awards Please read Jim's posting on the subject and forget all my crap about not getting credit for deleted countries. It is in full accordance with the DXCC rules (though not for 5BDXCC and Honor Roll) to be given credit for Germany 3 times (assuming you worked Germany before Sept. 17, 1973).

I can't refrain from adding a little comment on that.

I am not able to follow the line of thought as regards Germany. At a first glance, the rules seem to have been applied correctly. However, a second look reveals, that the same rules have been appplied twice in a counterproductive manner. What I am trying to say is this:

There once existed a DXCC country Germany (DL, DM). In 1973, this country was, DXCC-wise, split up into West Germany (DL) and East Germany (DM, later Y2). Thus two new DXCC countries were created, while the old one was put on the list of deleted countries, rightfully, as its place had been taken by the two new ones.

At this point, it might have been justified to claim credit for 3 countries. I have my doubts, though, that this should be done. The deleted country hasn't been deleted for nothing, but because it had been replaced by other ones. You're free, of course, to have nostalgic thoughts of the past gone; yet it won't do you much good in the end.

If I replace DXCC country with currency, it won't help me much to have a million old German marks if they have been replaced by two new currencies: Deutsche Mark and Mark der Deutschen Demokratischen Republik. It's only a reverie...once upon a time when I was a millionaire...

Now comes the point when these two countries get together to form ONE country out of the two (1990). Though politically, thanks Heavens, it certainly is NOT the same as before 1973, we have to look at it with DXCC eyes:

1. DXCC-wise, Germany till September 16, 1973 and as of October 3, 1990 is one and the same.

2. From September 17, 1973 to October 2, 1990 East Germany was a separate DXCC country which is now on the list of deleted countries.

Instead of deleting Germany from the list of deleted countries and thus re-establishing its status as an active country, the ARRL made the mistake that led to the current situation.

We then would have Germany as an active country and East Germany as a deleted country, which would actually reflect the real situation.

Any comments from the ARRL side?

73, Wolf.

Source record: 284917

Hi, I've seen various references to diode clip mods for the Radio Shack 2006 scanner, and I can track those down. What I am interested in confirming or disproving is a rumor from a local ham that the modern production of those radios have the diodes covered in a hardened goop to prevent someone from actual getting to them and doing the mod, similar to what has been done to the HTX100 to prevent it from being modified. Can anyone confirm this? Since the 2006 is on sale this week I am tempted...but I'd like contiguous coverage. Any other suggestions on similar scanners, or pro/con comments on the 2006 would be appreciated. Mail responses are fine. Thanks

3084. CBS violation of ECPA

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-24 14:33:45 UTC
From: BOB@WINROCK.ORG
Message-ID: <920924093317.2080131d@WINROCK.ORG>
Source record: 284919

We have all recently noticed an enhanced effort by the FCC to enforce regulations with increasing fines and penalties. Examples include the infamous 900 number on packet bbs and fines for hams who happen to have an antenna on a commercial tower with a burned-out light.

Last night on a CBS broadcast of "48 hours" a segment was aired on surveillance techniques which included a demonstration on how easy it is to monitor cellular telephone calls. "Live" calls were broadcast. This not only violates the ECPA but the Communications act of 1934 since the interception was not only intentionally monitored, but shared with others.

I believe the ECPA to be a stupid and misguided effort by cellular manufacturers to give the mistaken impression to cellular customers that their communications are indeed private, and I would like to see it repealed before other frequencies are declared off limits.

I intend to file a complaint with the FCC against CBS and all affiliates who re-broadcast the show in an attempt to press the issue. I encourage others who agree to do the same.

To file a complaint, send a letter outlining your compaint to:

Date: 1992-09-24 14:51:14 UTC
From: acp@cray.com
Message-ID: <1992Sep24.095114.9955@hemlock.cray.com>
Source record: 284916

My brother recently bought a Collins 51J4 receiver at a
local amatuer radio consignment shop.

The set has no cabinet and appears to have been rack mounted
and the front panel is painted a light gray semi-gloss instead
of the dark gray wrinkle finish usually seen on Collins
Eqpt. of this vintage. Would this be a military or commercial
version of the 51J4?

This set also appears not to have mechanical filters. I thought
that the 51J4 like the 75A4 had mechanical filters. Were
mechanical filters an option or could the set be special ordered
with only a crystal filer?

3088. Re: The Truth about UHF Connectors

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-24 15:48:35 UTC
From: rkarlqu@hpscit.sc.hp.com
Message-ID: <50030029@hpscit.sc.hp.com>
Source record: 284788

The main reasons I use N connectors instead of UHF are that
the N type is water proof (unlike the UHF) and the N type
doesn't require soldering to the braid like the UHF type.
With polyfoam coax, this is very difficult to do without
a lot of heat damage. Think about it: no other connector
besides UHF requires soldering the braid; they all use
crimp or clamp type attachment. Even (chuckle) RCA connectors
now come in crimp versions so you don't have to solder the
braid. The only crimp type UHF connectors I have seen are
for RG-58 only, not RG-8. And these are not waterproof like
clamp on type N's.

3090. Alinco DJ580 technical question

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-24 16:05:00 UTC
From: richw@hplsla.hp.com
Message-ID: <20360094@hplsla.hp.com>
Source record: 284645

The DJ580 remote control speaker-mike has some simple capabilities: I believe you can raise & lower the frequency, and one or two other functions. (I don't own one, or I might be able to figure this out myself...) Looking at the DJ580 schematic, it appears that this control is implemented with only a single wire, which goes right to the processor.

So, the big question is: How are the control functions implemented on this wire, and can other functions also be accessed remotely?

AMSAT sells a tracking program for the Amiga that works pretty well.
You can contact AMSAT at:
AMSAT P.O. box 27
Washington, DC, 20044
(301) 589-6062

Martha will be happy to take your order (I think it's about $40 for non-members)

If you find out about other programs I'd like to hear about it. Either
posted here or via email if you prefer.

I don't think the post stated that there were NO backups, and if it did it would be wrong. As you may notice on the shuttle screen there are several small circles strewn across the globe. Those are the ground comm-stations used during Apollo, and which serve as backup during shuttle flights. As I recollect, they're used frequently during flights where constant video is important, because due to the position of the shuttle video can't always be relayed through TDRS...

While it's disappointing that the districts don't mean as much as they used to, still, it seems that most of the time the number tells me where the op is. Imagine if the world adopted this tact! I think that would take a lot of the fun out, where instant recognition of a call location is half the fun of DXing. (IMHO!)

Do they recycle old calls? (e.g. W6xxx, WA6xxx, WB6xxx ad nauseum)

Good theory, perhaps your experience supports this.

Mine doesn't.

My wife's car has now suffered two sudden failures. Both batteries had
been maintained with distilled water. Both batteries had normal electrolyte
level. Both failed open.

From: chinatti@glasses.Princeton.EDU
Message-ID: <1992Sep24.164444.27057@Princeton.EDU>
Source record: 284923

I have a question about the GP300: in the USA, the radio is offered in 2 and 8 channel models, but I have heard that in some other countries, the GP300 is available with 16 channels, and an LCD display on the front. I was wondering if anyone knows what additional features the foreign model offers, especially with the LCD display, but possibly signalling, etc.. Is the display numeric or alphanumeric? If anyone has any of the answers to these questions, I'd love to hear from you by either posting to this group or e-mail.

Thanks in advance,
Steve

No they don't, and it's a very good way to ruin some good BNC connectors.
While you can insert a type-N male into a female BNC, the center conductor
will often spread the female contact and make it worthless for further use
as a BNC. I've seen very expensive test equipment ruined by using this
technique. Connector alignment is an important part of the mating process.
Use the right connectors.

Cross-posted to: tek.general,or.general,pnw.general,rec.radio.amateur.misc,rec.bicycles.misc

The Portland Marathon is looking for an Amateur
Radio Operator who is experienced at riding
a bike while operating a 2 mtr radio. We need
someone who can stay with the lead runner
(male or female, depending on how many hams
we find who can do this) while reporting times
at miles and race status. The lead runners
average around 12 mph for 26.2 miles for a
total time of about 2 hours and 15 minutes.

You provide the bike, radio, and watch and
you get a T-shirt and some food.

The Marathon is Sunday September 27 starting at
7:00 am (must be in position around 6:15 am) and
it starts from downtown Portland (4th and Madison).

We had someone lined up to do this, but at the last
minute they had to cancel.

If interested, call

> > The word is Bird. Bird is the word. Accept no substitutes. :-)
> > Gary KE4ZV
> >

When I was the service manager at Diawa USA, we tested our meters with a Bird. What's funny was that the specs were similar. Percent of full scale etc. The Main thing that I saw the Bird as having over the others, was it was almost indestructable. NOT that it was any more accurate. Especially if it has been through 20-30 owners and hasn't seen a calibration lab in years. The problem is that BIRD wattmeters are an Urban Legend in HAMdom. Most hams seem to think that that war surplus Bird they bought with the broken face plate is equal to an NBS transfer or primary standard.

Physical innards of the two types mentioned above. The Bird is a coaxial transmission line with a coupled parallel line probe. The Diawa meters use a pair of toroids for HF and a microstrip transmission line with the parallel line probe. The Bird is VERY well manufactured based on a Military design from over 50 years ago. The Diawa is manufactured for a commercial market.

Cost comparison. (These are from memory, don't flame me) The Bird basic meter costs $150. Add to that at least 2 $50+ slugs for reading forward power and reflected power (you WERE concerned with accuracy, and not trying to read the bottom 2% of the meter scale?) The Diawa meter in the same cost range, includes two other power ranges. (saved yourself 4 slugs eh?)

Ease of use comparison. Kodak made the phrase, "point and shoot" a generic term for "so easy, any moron can get good results". When using a Bird Watt meter, you have to (at a minimum) rotate the slug and then read the graph chart for the VSWR reading. Possibly swap slugs to keep the reading in the middle of the meter scale (where it's accurate). The Diawa meter being a cross needle (dual) movement is immediate (even if not that extra 1-2% more accurate). When the output power (or apparent output power, see below) is changing, the Diawa takes it hands down for adjusting a tuner for best match between the radio and the amtenna.

Here's the real deal on watt meters. Both the Bird and the others for the most part are VOLTMETERS. And they ASSUME (are calibrated with the idea) that the Load Resistance is 50 ohms. Once the load impedance starts getting wierd, the accuracy of the reading goes to hell in a bucket.

There are two types of measurements made, absolute and relative. Absolute measurements are difficult at best and impossible in some cases. Relative measurements are the ones we should really concern ourselves with. "Did the power going to the antenna increase and did the power coming back decrease?" If the answer to that was yes, then who really cares if the output power measurement shows 100 watts, 95 watts or 105 watts. The best piece of test equipment you can have in your shack is one that is reliable and easy to use. Accurate is nice, but NOT an absolute requirement.

I had the Bird, and I sold it. (Along with the nice leather case, six pairs of quick change connectors and 8 slugs) No, I don't want to think about how much money it took to accumulate that. For measuremnts here in the shack, I have an old Monarch CB VSWR bridge. (They were sold under various names in the 60-70's) It works great at low powers up through 500 MHz. And for pure glitz, (it spends most of it's time in it's box) the new Diawa LCD digital power meter. (yup, being the service manager had its perqs.)

3101. UHF connectors cause cancer in lab rats.

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-24 17:10:08 UTC
From: jangus@skyld.UUCP
Message-ID: <717354608snx@skyld.UUCP>
Source record: 284943

No, but they get blamed for everthing else.

How well a UHF connector performs is related with who made it.
If you buy a connector with the dielectric material made of cheese or
some other plastics substitute, it ain't gonna work well at UHF.

If you buy a UHF connector hand made on some deserted island by
deformed dwarfs using salvaged materials from the bronae age it ain't gonna
work.

I you buy a UHF connector made with a semi-conducting metal (zinc
aluminum aka zamac comes to mind) with cast threads, even if it does work, it
ain't gonna last long.

I don't want this to sound like a plug for an american manufacturer,
but if HAM's would stop trying to save a damn dollar on a connector and buy
the brass bodied, silver plated with the phenolic insert PL-259 and SO-239
connectors from Amphenol, the problems and horror stories about UHF connectors
would stop. (Hint: bargan right angle connector vs "real one" $2 vs $10. Is
you're rig worth the $8 you saved?)

Here's the scenario: Guy runs out, drops $3500 on a tower and antenna.
Pays $2500 for an HF rig. Runs 9913 coax to said antenna. And then buys the
cheapest connectors he can find at Radio Shack, or the swap meet. (Sorry paul,
rpo@tandy.com, but those connectors are really terrible) I have no sympathy for
the guy. (Or gal for you humor impaired types left over from a previous flame
war). HF rig you say, it happens with the VHF/UFH crowd too.

(Warning, generalization) HAMs seem to revel in doing a 98% job in
everything they touch. Do the same thing with PC's too. Spend $5000 on the box
with all the goodies, and then trust $0.25 swap meet diskettes with thier data
and that $80 drive they paid for. Considering how much money they save by using
"evaluation" (polite term for copied copyrighted) software, you'd think they
would spring for decent disks to copy stuff with.

Standard comment I hear, "I ain't got that kind of money....". Well,
wait until next month to finish that project, just do it right the first time
and you'll never have to wonder whats wrong with it later.

FROM: G.L.CARMAN

The final heard list was saved on 09/19/92 at 22:48:11, SERHRD = 3785.
The final worked list was saved on 09/19/92 at 22:48:21, SERWKD = 6071.
The 6013 that I remembered was the serial number of the last station
that made the worked list (N5VSP).
6071 is just the total number of connects, whether or not an
acknowledgement of their serial number frame was heard on board or not.
Only 456 of those had their ack frame received and got on the worked list.
The heard counter (SERHRD) is incremented each time a frame is received
from a new callsign; new meaning not in the current tnc heard buffer of
the last 35 calls heard. If a station call is received later after he
has been scrolled out of the heard buffer, he will cause the SERHRD
counter to increment again. The 35 call heard buffer was captured to disk
each time the SERHRD counter changed by 30 IF the PGSC was connected and
the logging script was active (which I estimate was only for about 60%
of the total robot time). There were 717 unique calls in all of the heard
lists captured. Stations desiring a qsl card for making only the heard
list should also send in a copy of a received QRZ beacon with their call
in it, since the logging script may not have been running at that time.

This is false. Since we are dealing with a transformer primary coil, and not a transmission line or antenna here, using 1/4 wavelengths of wire has no advantage. The voltage goes through a complete 180 degree reversal at opposing ends of the coil regardless of it's length. The important things to consider for the primary coil are it's Q, it's coupling to the secondary, it's matching to the power oscillator, and of course, frequency of oscillation. That's determined mostly by the capacitance of the tube and tuning capacitors, as well as circuit strays.

For best effect, you want both the primary and secondary coils to be resonant at the operating frequency. Since the secondary must have many more turns than the primary, you want to minimize winding capacitance by use of proper winding technique. Since the secondary has many fewer turns, you must add capacitance in parallel with the coil to lower it's resonant frequency. The plate capacitance to the power tubes will be of use, but normally you have to add additional capacitance to get the primary down to the self resonant frequency of the secondary. With a power tube oscillator, normal HV tuning capacitors, like those used in high power transmitters, work fine. Doorknob capacitors can be used for fixed shunt capacity. To get the system to take power, you will likely have to tap the tube down on the primary coil. Great care must be taken to prevent unwanted interactions at this point.

If you use a neon sign transformer and rotary spark gap instead of a power oscillator tube, you can neglect tube capacitance but must figure gap capacitance. Making the assembly take power becomes more of a cut and try operation because the output impedance of the transformer and spark gap are much less well characterised than that of a power tube oscillator.

As a design example, I'll describe a coil made by a friend of mine. The first step is to choose a secondary size and wind it. Material choice is important here. Glass or some plastics make a good support

structure. In this case a 6 foot lucite tube was choosen. Magnet wire was chosen for the coil. Since you want to avoid large amounts of interturn capacitance, the wire is scramble wound in short sections separated by gaps. This reduces net capacity of the coil while maintaining insulation values.

After the coil is completed, use a GDO to determine the self resonant frequency. This will determine the construction of the primary circuit. The primary must withstand high circulating current and maintain a high Q. Copper ribbon was chosen as the primary material. The coil should have a length/diameter ratio of about 2:1. The secondary sets a minimum value for the coil diameter and the number of turns will determine the step up ratio. So you make a coil larger than the secondary with as few turns as possible to make up the height. Now measure the inductance of the primary and choose the proper amount of capacitance to resonate it at the secondary self resonant frequency. Don't forget to include tube capacitance if a tube oscillator is used. Circuit strays should have minimal effect, but allow some adjustable capacitance to tune them out. Tapping the tube output on the coil will be an experimental effort since the load impedance presented by the secondary is unknown.

Tune up consists of applying power to the oscillator and tuning the primary for resonance at the secondary self resonant frequency. The primary tap is adjusted for maximum current draw at resonance. Depending on how well you've done your job, such a coil, using a 4-400A as a power oscillator in this case, should produce streamers of 48 to 60 inches. Test it outdoors. CAUTION: this thing uses lethal currents and voltages. Use extreme caution in making adjustments or approaching the operating coil. Remember that high voltage capacitors can store charge for long periods after the equipment is de-energized.

A final note: These things can be illegal as hell due to the strong signals they emit. Be wary of any interference to licensed radio operations. Be especially careful of avoiding MW ship frequencies and navigation beacons.

Gary KE4ZV

3104. Examination Opportunities Scheduled 9/23/92 to 1/11/93

AMATEUR RADIO EXAMINATION OPPORTUNITIES

The following test session information is provided by the ARRL/VEC for the upcoming six to eight week period. For further information, please contact the test session CONTACT PERSON at the telephone number provided. If necessary, you may contact the ARRL/VEC at 203-666-1541 x282 for additional information. Electronic mail may be forwarded to the ARRL/VEC via USENET at "bjahnke@arrl.org" or via MCI Mail to MCI ID: 215-5052.

Although the test session information presented here does not indicate whether walk-ins are accepted or not, most test sessions do allow walk-ins. We encourage you, however, to always contact the CONTACT PERSON at the telephone number provided so that the VE Team is aware that you be attending the test session.

STILL NEED TO PREPARE FOR YOUR EXAM?

If you would like information on how to become licensed; or how to locate Amateur Radio clubs, instructors, licensing classes and/or Novice examiners in your area; please contact the ARRL Educational Activities Department (EAD) at 203-666-1541 x219. The EAD can also provide information on recommended study materials. Electronic mail may be forwarded to the ARRL EAD via USENET at "rwhite@arrl.org" or via MCI Mail to MCI ID: 215-5052.

EXAM LISTINGS - DEFINITION OF FIELDS

STATE
Test Date,VEC,City,,Contact Phone,Contact Person

The SECOND field in the following listing specifies the VEC which is coordinating this examination. This single-character designator denotes the VEC as defined below. An "A" (for example) indicates that this examination is coordinated by the ARRL/VEC.

For further information on any examinations listed, you may contact the coordinating VEC.

A = ARRL/VEC, 225 Main St, Newington, CT 06111; (d) 203-666-1541
Test fee for 1992 is $5.40.

X = Anchorage ARC, 2628 Turnagain Parkway, Anchorage, AK 99517;
(d) 907-786-8121, (n) 907-243-2221 (or) 907-276-5121

(or) 907-274-5546

C = Central Alabama VEC, 1215 Dale Dr SE, Huntsville, AL 35801;
205-536-3904

N = Charlotte VEC, 227 Bennett Ln, Charlotte, NC 28213;
704-596-2168

D = Great Lakes ARC VEC Inc., PO Box 273, Glenview, IL 60025;
708-486-8019

E = Golden Empire ARS, PO Box 508, Chico, CA 95927; No phone.
Test fee for 1992 is $4.00.

G = Greater Los Angeles ARG, 9737 Noble Ave, Sepulveda, CA 91343;
818-892-2068, 805-822-1473. Test fee for 1992 is $3.00.

J = Jefferson ARC, PO Box 73665, Metairie, LA 70033; No phone

K = Koolau ARC, 45-529 Nakuluai St, Kaneohe, HI 96744;
808-235-4132

L = Laurel ARC Inc., PO Box 3039, Laurel, MD 20709-0039;
(d) 301-572-5124, 301-434-6087, (n) 301-588-3924

M = The Milwaukee RAC Inc., 1737 N 116th St, Wauwatosa, WI 53226;
414-774-6999

H = Mountain ARC, PO Box 234, Cumberland, MD 21502; 304-289-3576

P = PHD ARA Inc., PO Box 11, Liberty, MO 64068; 816-781-7313

R = Sandarc-VEC, PO Box 2446, La Mesa, CA 92044; 619-465-3926

S = Sunnyvale VEC ARC, PO Box 60142, Sunnyvale, CA 94088-0142;
408-255-9000

T = Triad Emergency ARC, 3504 Stonehurst Pl, High Point, NC 27260;
919-841-7576

W = Western Carolinas ARS VEC, 5833 Clinton Hwy - Suite 203,
Knoxville, TN 37912-2545; 615-688-7771. Test fee for 1992 is $5.40.

5 = W5YI-VEC, PO Box 565101, Dallas, TX 75356-5101; 817-461-6443
Test fee for 1992 is $5.40.

3105. Troubleshooting 2 meter amp

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-24 17:55:49 UTC
From: radneyt@iccgcc.decnet.ab.com
Message-ID: <1992Sep24.125549.8939@iccgcc.decnet.ab.com>
Source record: 284925

I own a Mirage amplifier for 2 meter (2w in 30w out).
I had been having some radio difficulty so I borrowed a watt meter
to check the output. With about 2.5 in I get about 1.75 out.
The relay sounds like it's engaging ok. Is this a frequent problem with
these amps? Any suggestions?

Thanks,
Lee

Could someone please tell me the meaning of the digit in UK callsigns.
(ie which digits have been allocated to Class-A and which to Class-B)

Or is it a lot more complicated than that?

[I've limited the distribution of this message to the UK.]

Graham Rule (who hopes to become GMsomething next year)

3108. Need wideband VFO (270 - 670 MHZ).

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-24 18:44:38 UTC
From: mleech@bnr.ca
Message-ID: <1992Sep24.184438.19622@bcars6a8.bnr.ca>
Source record: 284928

I'm looking for a VFO that spans the range 270 - 670 MHZ. Preferrably, it should be stable, with low phase noise. The application is radio astronomy (searching for millisecond pulsars in the 200-600 MHZ region -- 70MHZ IF).

I've had a few thoughts that I'd like to bounce off the net:

Use the UHF tuner from a TV and phase-lock it to an ovenized crystal.

Find a broken wideband receiver whose VFO still works and use that.

Use the VFO from a scanner. Any idea how modular most radio-shack type scanners are? Is the VFO easily extricable?

3109. Re: Rhombic questions/help

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-24 19:06:12 UTC
From: alanb@hpnmdla.sr.hp.com
Message-ID: <14570499@hpnmdla.sr.hp.com>
Source record: 284950

In rec.radio.amateur.misc, tonyp@convex.com (honey bunny) writes:

> o Performance factor of a rhombic over a quad.

When I worked at W1AW, we used a large rhombic on 20 meters for the code practice & bulletin transmissions. As I recall, it was 6 wavelengths long on each leg (about 400 feet) and about 700 feet from pointy end to pointy end. When we installed the new 120 foot tower with stacked 4-element monobanders, we ran a series of tests to see which was better. On our regualr bulletin transmissions, we would transmit long "dahs" on each antenna in turn and asked our listeners to send in signal reports. We did this over a number of days.

I compiled the reports and plotted them on a map of the US. Both antennas were pointed due west from Newington, CT, which would put the boresight somewhere in central Calif. I found that the California reports showed the antennas to be about equal, but listeners in the northern states (Washington, etc.) reported that the beam was about 1 S-unit stronger. In other words, both antennas had about the same gain, but the stacked beams had a broader horizontal beamwidth.

> o Am I better off using the 1700' (maximum length wire) or
> cutting it to a resonate length?

Almost any length will work, but the shape (angle formed by the wires) depends on the number of wavelengths per leg.

> o Will it work better on "other bands" (because of the length of
> wire) than a tuned dipole cut for the "specific bands"?

Yes, but the wire angle will only be correct for one band (see above.) It will work on the other bands, but at reduced gain.

> o The house is in the Southern corner (so is the feedpoint).
> Does this mean it will radiate North?

Yes. If you terminate the far end in the correct value resistor (around 600-800 ohms), the antenna will be unidirectional. Otherwise it is bi-directional (although still a couple dB) better to the North.)

> o It "is" fed from a corner, and not the middle of a leg, correct?
Yes

> o Do you feed it with RG58 or 300 ohm line?
Balanced feedline. 300-ohm line and a tuner will work fine.

The ARRL Antenna Book has an excellent section on rhombics with all the design information.

Here's a cheap idea that works wonders. Go to your local House Appliance
parts department (such as GE parts) and ask for a Clothesdryer "Ozone Lamp".
That's a little incandescent bulb with gas that emits more than enough
ultra-violet to erase EPROMs. Connect in series (yes, series) with 40W
household bulb to 120VAC. 10 minutes with 2 inches separating the bulb and
EPROM erases it nice and clean. Do not stare at bulb when lit.

The bulb in clothesdryers is intented to generate a small quantity of ozone
which kills germs and bacteria.

So we're supposed to notify the FCC when we've moved, eh?
I always wondered about that. What is the procedure for
letting them know- is there a special form, or can we just
drop a letter to our local office?

Sorry if this has been answered, I just dropped into this
string a little late. Also sorry I didn't even know how
soon after a move I'm supposed to do this.

I bought the Radio Shack one, then got 2 male rs to female bnc and 2 female rs to male bnc connectors and it works out just fine, especially since most non-ht antennas seem to use the rs connector. What I don't like about the Radio Shack one is that you have to convert the power/swr readings, since it is set for 10-15 watts or 50/60 watts and my Alinco ht is only 3/5 watts.

Michael Barbitta

Still waiting for the FCC to send me my letters and number.

According to someone who emailed me who is in the space program,
there was no backup for the failure... budget cuts and stuff.
MANY OF THE APOLLO GROUND STATIONS NO LONGER EXIST....
There are gaps in shuttle communications....

>
>Yes, there was something in QST a couple of years ago about this. If you
>get caught, the FCC can and will do bad things to you...

I didn't think this was at all illegal, even if it's perhaps immoral.
There are plenty of well-known non-US DXers who have US calls (VK9NS,
3W3RR for starters) and who don't even live in the USA, let alone have
a brother who does. There is at least one well-known contester who
went through several calls from different areas in a short time, hoping
for one that sounded good. Does anyone know for sure that this is
something the FCC cares about? (apart from the fact that it uses up
the callsign base faster, of course, and involves them in even more
paperwork). I dunno, I guess it means you file a change-of-address
thingie and then don't move, or you give an illegal home address at
the time - but I don't remember having to take an oath about where I
actually lived at the time. I have never emitted RF from my home
address in the 5 yrs I've had a license, but so what?

I believe you can even trade in your current call for one from the
same series if you don't like it - if you get N5LFL but are always
getting L and F mixed up in CW, you can ask for another one. If you
then get N5LID, you can ask again.

I suppose they could arrange things so that you get a call from the
area in which you took the test - there would still be people crazy
enough to travel to some other part of the country to take a test,
but not that many. In any case, you soon become attached to any
call, however awful it might sound at first.

Disclaimer: none of this might be true...

What is true is that when I got my G call I went round in person to
wherever the issuing place is and they gave me a choice of anything
between G3NMM and G3NMZ, so I chose what I thought had the nicest
rhythm on cw. There's not many people know that -

If it's cheap you want (and it sounds like it, from your possible
solutions!) get an old analog signal generator. My Measurements
box must weigh 50 pounds but it's *very* stable in both amplitude and
frequency and covers about 10MHz to 500MHz. There are similar units
with wider ranges available from surplus dealers. An old Tektronix or
HP from the 60s would probably be perfect. Forget TV tuners and scanners;
far too noisy, too broad banded, and not enough gain.

I've been thinking about an amateur radio astronomy project for a while and
had a nice chat with the Director of the UM radio observatory last
weekend at their open house. He made a couple of suggestions for projects
at 450MHz and 21cm using helixes and dishes.

From: johnc@endor.harvard.edu
Message-ID: <1992Sep24.210032.453@das.harvard.edu>
Source record: 284938

Greetings:

I am not an amature radio enthusiast so please excuse this post.

I work in the Physics department at Harvard and run an Ion Accelerator for the academic community. One of the componants is a very HV power supply.

I am trying to locate a transformer quickly that has the following specs:

Primary 115 VAC
Secondary: 1250 VAC @ 450mA.

I am told that such a transformer is used for a plate power supply in some ham applications. Any help that you could give me in locationg one of these beasts would be most appreciated. I have checked the more common vendors and tranformer manufacturers but seems like most companies don't keep these on the shelf. Are there any electrical surplus places that you could reccomend?

Thanks in advance,

John Chervinsky

+Does anyone have any information and experience with this rig?

I bought a 751A a couple of months ago and I like it a lot. It has pretty
much all the features I'd want, along with a fine receiver.

Overview of features (all standard): 10-100W, 160-10M, SSB/CW/AM/FM/RTTY;
various filters, including 500 Hz CW filter; RIT/XIT; PBT (pass-band tuning,
a very nice anti-QRM feature) and notch filter; RF speech processing; 32(?)
memories; dual VFO's; iambic keyer; receiver preamp/attenuator. Comes with
hand mike.

I got mine for $1150 mail-order from Texas Towers. Power supply is extra.
You can get either the built-in PS for around $200 or get an external one
for around $150.

The older 751 model was somewhat buggy, but that's all been fixed, as
far as I can tell.

DEFINITIONS:

Date (day only)
Possible Magnitude of Solar Flaring (LOW=C-class, MOD=M-class, HIGH=M or X)
HF Propagation Conditions for LOw, MIddle, HIgh, and POlar areas (see below)
HF Short Wave Fade Probability (in %)
HF Maximum Usable Frequency in +/- percent above seasonal normals.
HF Prediction CONfidence Level (in %)
VHF Sudden Ionospheric ENHancement Probs (in %), weighted for low-mid lats
PROBability of "s"poradic E (Es) during the UT day for low, mid and high lats
VHF AUroral BacKScatteR Probs (in %) for LOw, MIddle and HIgh Latitudes
VHF Overall Global DX Potential (in %) - weighted for Low and Middle latitudes
Geomagnetic Activity Kp Index (peak value - see below)
GeoMAGnetic Activity Ap Index (peak value - see below)
AURORAl Activity for LOw, MIddle and HIgh Latitudes (see below)
```

HF Prop. Quality rated as: EG=Extremely Good, VG=Very Good, G=Good, F=Fair,
P=Poor, VP=Very Poor, EP=Extremely Poor.
Probability of Sporadic E (Es) for the various latitudes is given in percent.
Kp Planetary Index rated: 0=V.Quiet, 1=Quiet, 2=Unstld, 3=Active, 4=V.Active,
5=Minor Storm, 6=Major Storm, 7=Maj-Sev Storm, 8=Severe Storm, 9=V.Severe.
Ap Planetary Index rated: 0-7=Quiet, 8-16=Unstld, 17-29=Active,
30-49=Minor Storm, 50-99=Major Storm, Severe Storm >=100.
Auroral Activity rated: NV=Not Visible, LO=Low, MO=Moderate, HI=High,
VH=Very High.

PEAK PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (25 SEP - 04 OCT)

```

CONFIDENCE LEVEL: 70%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

GRAPHICAL ANALYSIS OF 90-DAY AVERAGE SOLAR FLUX

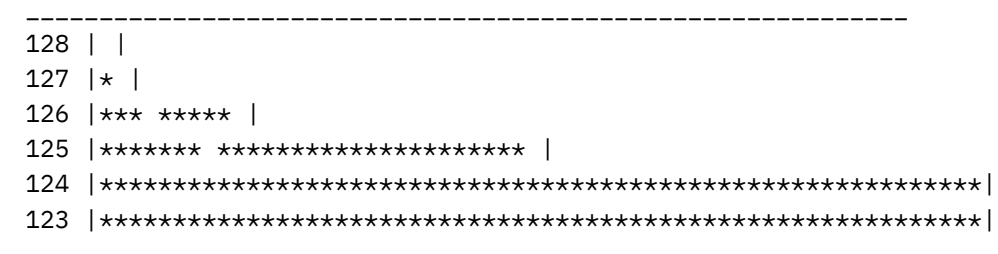

Chart Start: Day #208

NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

CUMULATIVE GRAPHICAL CHART OF SUNSPOT NUMBERS

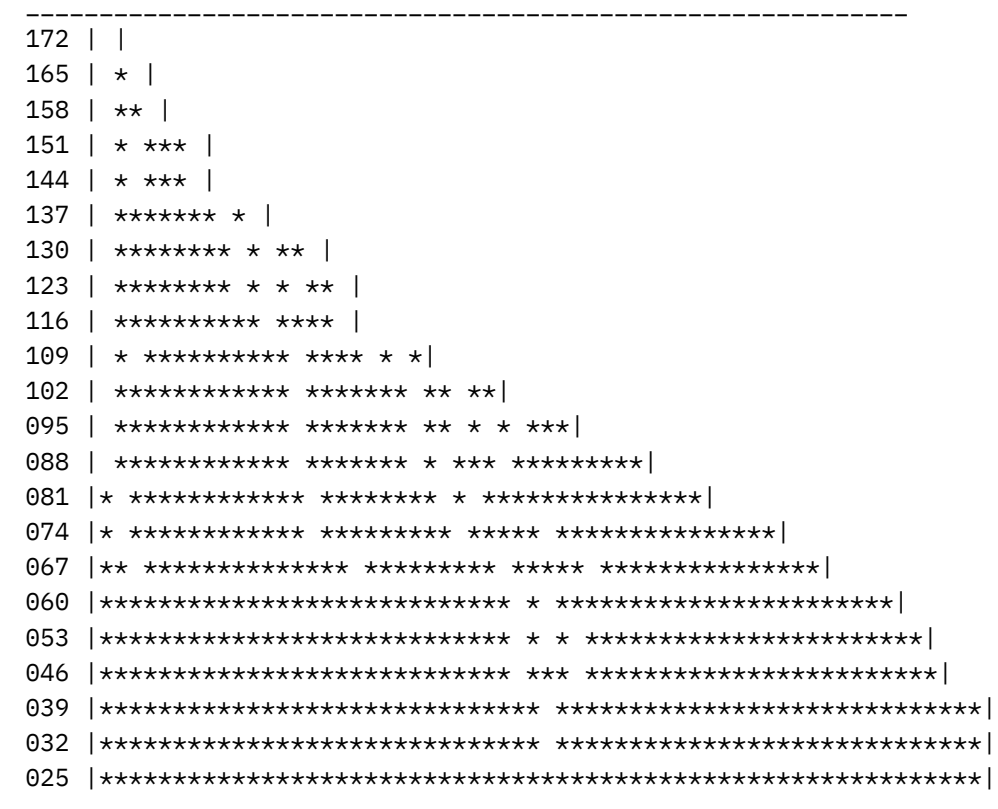

Chart Start: Day #208

NOTES:
The graphical chart of sunspot numbers is created from the daily sunspot number counts as reported by the SESC.

NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "Oler@Rho.Uleth.Ca" or "COler@Solar.Stanford.Edu". This document, as well as others and related data and forecasts exist on the STD BBS at: (403) 756-3008.

>
>So we're supposed to notify the FCC when we've moved, eh?
>I always wondered about that. What is the procedure for
>letting them know- is there a special form, or can we just
>drop a letter to our local office?
>

Most definitely you should tell them you have moved; otherwise
You should obtain FCC Form 610 and apply for a change of address.
You can request these forms from the FCC directly if you need to; I have
done this in the past when I have moved.

>Sorry if this has been answered, I just dropped into this
>string a little late. Also sorry I didn't even know how
>soon after a move I'm supposed to do this.

I am not sure there is an exact time limit, but the key to the
whole thing is you should be able to receive any mail the FCC sends
you in a timely fashion, and likewise respond in a timely fashion.

Unless it's only your station address, and not your mailing address,
that has changed, I would do it within the first month of moving.
Don't trust USPS forwarding to help you keep your license!

I would go to Radio Shack and get the "Novice Class License"
book and tapes. They also have other license guides and another
ham radio book as well.

You can now get a license without knowing Morse Code; this license
class is called Technician.

3124. Frequency Counter Accuracy

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-24 23:09:28 UTC
From: retzer@convex.csd.uwm.edu
Message-ID: <19thr8INNfhb@uwm.edu>
Source record: 284944

I recently purchased a Startek BG-15 frequency counter. I tried to test
its effectiveness with a cordless phone and a CB radio (not MY cb, but
one that belonged to a friend ;-). In any case I'm a little dissapointed.
I could'nt get any reading below about 52 MHZ on the phone (which I assume
is in the 49 MHZ range) and the readings I did get were not stable, implying
that it was not locking onto a frequency.

As for the CB, the results were mixed. About 50% of the time the reading was
close but did not "lock on", ie. fluctuated around the correct reading.
Other times it locked dead on to the correct frequency. I was sitting in
the car with the antenna sticking out the window.

My question is:
Is this the best I can expect from a frequency counter?
(this is the first one I've used).
Or,
Does it sound like there might be a problem with the unit?
Or,
Am I doing something wrong and/or overlooking something?

Thanks in advance,
Joe Retzer N9QXL

>Thanks in advance.

>--
Go to your local beauty supply store and purchase a germicidal lamp. I have
one that cost $15.00 (25watt) and it will erase eproms in about 3 or 4 minutes.
Just plug it into a standard 18" flo-tube lamp.. Be sure to NOT EVER look
directly at the lamp. It is unfiltered UV and WILL damage your eyse, plus
give you a real good skinburn if exposed for any length of time. (12 mins)
I usually leave the room when I am erasing chips.

3126. Re: Rhombic questions/help

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-25 01:06:12 UTC
From: Alan.Bloom@mailbox.bison.mb.ca
Message-ID: <717712154.55@mailbox.bison.mb>
Source record: 284758

Organization: Hewlett-Packard, Santa Rosa, CA

In rec.radio.amateur.misc, tonyp@convex.com (honey bunny) writes:

> o Performance factor of a rhombic over a quad.

When I worked at W1AW, we used a large rhombic on 20 meters for the code practice & bulletin transmissions. As I recall, it was 6 wavelengths long on each leg (about 400 feet) and about 700 feet from pointy end to pointy end. When we installed the new 120 foot tower with stacked 4-element monobanders, we ran a series of tests to see which was better. On our regualr bulletin transmissions, we would transmit long "dahs" on each antenna in turn and asked our listeners to send in signal reports. We did this over a number of days.

I compiled the reports and plotted them on a map of the US. Both antennas were pointed due west from Newington, CT, which would put the boresight somewhere in central Calif. I found that the California reports showed the antennas to be about equal, but listeners in the northern states (Washington, etc.) reported that the beam was about 1 S-unit stronger. In other words, both antennas had about the same gain, but the stacked beams had a broader horizontal beamwidth.

> o Am I better off using the 1700' (maximum length wire) or
> cutting it to a resonate length?

Almost any length will work, but the shape (angle formed by the wires) depends on the number of wavelengths per leg.

> o Will it work better on "other bands" (because of the length of
> wire) than a tuned dipole cut for the "specific bands"?

Yes, but the wire angle will only be correct for one band (see above.) It will work on the other bands, but at reduced gain.

> o The house is in the Southern corner (so is the feedpoint).
> Does this mean it will radiate North?

Yes. If you terminate the far end in the correct value resistor (around 600-800 ohms), the antenna will be unidirectional. Otherwise it is bi-directional (although still a couple dB) better to the North.)

> o It "is" fed from a corner, and not the middle of a leg, correct?
Yes

> o Do you feed it with RG58 or 300 ohm line?
Balanced feedline. 300-ohm line and a tuner will work fine.

The ARRL Antenna Book has an excellent section on rhombics with
all the design information.

3127. Re: Wanted: EPROM eraser (or kit)

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-25 01:06:27 UTC
From: jh25s56@sycom.mi.org
Message-ID: <jh25s56.487k@sycom.mi.org>
Source record: 284952

I made a fine eraser with a small flourescent fixture (from a phone booth, don't ask) and a special florescent bulb. You have to get a "Germicidal" bulb such as is sometimes used in barbor shops to irradiate their tools. These have no coating, look like a clear glass tube and glow with a light blue discharge that hurts your eyes. The "Black Light" ultraviolet bulbs are filtered to eliminate all the short wave lengths and WON'T WORK. My germicidal bulb cleans off an EPROM in less than two minutes.

3128. ICOM R1 troubles...

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-25 01:49:40 UTC
From: hemstree@greyrock.mso.colostate.edu
Message-ID: <HEMSTREE.92Sep24204940@greyrock.greyrock.mso.colostate.edu>
Source record: 284953

I am the proud owner of an ICOM R1!

Unfortunately, the cautions that were given to me at the time (which I disregarded) at which I bought the unit turned out to be true. Namely that the radio has a bit of a (crosstalk / intermod / selectivity) problem. The problem seems to be most greatly manifested in the 400Mhz band. The manifestation is that signals close (200Khz) to the signal that the radio is tuned to will squelch the radio while providing no meaninful signal to be demodulated.

Other than this, the radio is great, the size is amazing! The broad band reception is also utterly amazing. So, I am very interested in finding a solution to the problem that I am experiencing.

So, has anyone found a solution to this problem with the radio?

If so, please clue me in!

Thanks,

Charles

>mismatch), not absorption (true power loss).

This is my experience as well. The UHF connector gets reflective at
higher freqs. due to improper impedance matching. This was the reason
for the 'constant impedance' connectors like the N and the BNC/TNC.

One point of interest: I would like to see you repeat the experiment
with and without BNC's in-line. I have done work at the 900-1Gig range and
found BNC's to basically be worthless above about 500 MHz. The bayonet
does not provide a good, solid ground at higher frequencies. That's why
cellular phones use TNC's.

>Bottom line: UHF connectors work fine through the VHF range, and
>are not too bad even on the 420 MHz band if you can stand about
>.1 dB mismatch loss per connector.

Unless your data was in error due to the BNC's.

...

>AL N1AL

NOT SO! I am glad there are people like you to help steer people away from
myths that could cost them money, or worse, make them look foolish. (I have
looked very foolish with my batteries on wood for years ;-)

3130. Re: Ham radio used as back up comm to shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-25 03:00:06 UTC
From: rdale@nyx.cs.du.edu
Message-ID: <1992Sep25.030006.6544@mnemosyne.cs.du.edu>
Source record: 284954

As stated there are backups, but no not full-time. That is because
it is not mission-essential to have 100% comms. Before TDRS
they had to make do with whenever the shuttle overflew the site.

Try "Information Unlimited" in Amherst, New Hampshire. I don't recall
their address or phone number, but you can find it in the back of electronic
magazines like Radio-Electronics.

I built a Jacob's Ladder with a 8kv 250ma neon sign transformer with impressive
results.

Guy

>I always wondered about that. What is the procedure for
>letting them know- is there a special form, or can we just
>drop a letter to our local office?
>

Most definitely you should tell them you have moved; otherwise
You should obtain FCC Form 610 and apply for a change of address.
You can request these forms from the FCC directly if you need to; I have
done this in the past when I have moved.

>Sorry if this has been answered, I just dropped into this
>string a little late. Also sorry I didn't even know how
>soon after a move I'm supposed to do this.

I am not sure there is an exact time limit, but the key to the
whole thing is you should be able to receive any mail the FCC sends
you in a timely fashion, and likewise respond in a timely fashion.

Unless it's only your station address, and not your mailing address,
that has changed, I would do it within the first month of moving.

3135. Frequency Counter Accuracy

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-25 05:09:28 UTC
From: Joe.J.Retzer@mailbox.bison.mb.ca
Message-ID: <717712154.36@mailbox.bison.mb>

Organization: University of Wisconsin - Milwaukee
Reply-To: retzer@convex.csd.uwm.edu

I recently purchased a Startek BG-15 frequency counter. I tried to test
its effectiveness with a cordless phone and a CB radio (not MY cb, but
one that belonged to a friend ;-). In any case I'm a little dissapointed.
I could'nt get any reading below about 52 MHZ on the phone (which I assume
is in the 49 MHZ range) and the readings I did get were not stable, implying
that it was not locking onto a frequency.

As for the CB, the results were mixed. About 50% of the time the reading was
close but did not "lock on", ie. fluctuated around the correct reading.
Other times it locked dead on to the correct frequency. I was sitting in
the car with the antenna sticking out the window.

My question is:
Is this the best I can expect from a frequency counter?
(this is the first one I've used).
Or,
Does it sound like there might be a problem with the unit?
Or,
Am I doing something wrong and/or overlooking something?

Thanks in advance,
Joe Retzer N9QXL

>at opposing ends of the coil regardless of it's length. The important

Let me try and explain this because I think what I said is correct.
First off, yes, there is a 180 degree phase reversal between primary and secondary, but this is not what I was refering to. I was talking about the voltage standing waves in the secondary, itself. Since this is (ideally) a single frequency resonant coil, by using 1/4 wavelength (or some odd multiple thereof) you insure that the voltage at the free end is at its maximum value, rather than having this maximum appear somewhere else along the secondary windings. Note that this is not a requirement for a resonant system, but is necessary, I believe, if you want the highest possible voltage at the free end of the coil. (And thus, the longest sparks.) Two reasons occur to me why a single quarter wavelength should be used. First, it's a lot less wire to deal with. Second, by avoiding voltage maximums along the body of the secondary there is less danger of the windings arcing over on themselves, or anything else. Again, the frequency of the secondary can be tuned by use of a capacitance at the free end. This is similar to the "capacitance hat" used in some antenna designs to allow a shorter radiator to be used.

The 1/4 wavelength secondary is cited by Tesla as a necessary element in producing greatest possible arc length in his notes from his Colorado Springs experiments, and also in the book "Tesla Coil Secrets" by R. A. Ford.

3139. Making Scanners Illegal

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-25 06:29:43 UTC
From: armille@afterlife.ncsc.mil
Message-ID: <1992Sep25.062943.26944@afterlife.ncsc.mil>
Source record: 284964
Cross-posted to: alt.radio.scanner,rec.radio.amateur.misc,rec.radio.shortwave

From "Popular Communications 1992 Summer Communications Guide" p14-15:

"At the time of this writing there was pending in the Congress a bill (HR 1674) that would amend Section 302 of the Communications Act to prohibit the manufacture or importation of any radio capable of:
`a. receiving transmissions in the frequencies allocated to the domestic radio telecommunications service,
b. readily being altered by the user to receive transmissions in such frequencies, or
c. being equipped with decoders that convert digital cellular transmissions to analog voice audio.'
This would mean an end to general coverage scanners. They would be contraband. This bill passed the House of Representatives on September 24, 1991 and is now in the Senate Commerce, Science and Transportation Committee."

I have already seen stories in the media interviewing cops discussing the dangers of scanners as they claim they are "being used by the drug lords". Making technology illegal is already close at hand thanks to the cellular lobby; the War on Drugs will easily expand the same notion to other portions of the spectrum. And why shouldn't fire, local government, other public safety organizations, indeed private business be granted the same illusion of "privacy through legislation"?

I do not have the Senate bill number; however I suspect the information provided above should be sufficient for your two local Senators to understand which bill you are referring to. I urge everyone to contact their Senators and urge deletion of this portion of the bill. You can rest assured if you do nothing Congress will try to make radios, like guns, an inherently evil tool to be banned.

>band. The manifestation is that signals close (200Khz) to the signal that
>the radio is tuned to will squelch the radio while providing no meaninful
>signal to be demodulated.

I've had similar problems with my unit, and I found it to be a bit too
sensitive, at least for my use. I got hold of a variable attenuator
(0 - -30 dB in 3dB steps) and found things improving when reducing
signal strength.

Also, intermod from a nearby broadcast FM station running ~.5 MW has
been somewhat of a problem, yielding 2x and 3x intermod products that
can be heard loud and clear in the most unusual places. A good RFI
filter with a center frequency of about 100 MHz and a cutoff rate of
>20 dB/octave would probably help.

regards,

ragnar

I made a fine eraser with a small flourescent fixture (from a phone booth,
don't ask) and a special florescent bulb. You have to get a "Germicidal" bulb
such as is sometimes used in barbor shops to irradiate their tools. These
have no coating, look like a clear glass tube and glow with a light blue
discharge that hurts your eyes. The "Black Light" ultraviolet bulbs are
filtered to eliminate all the short wave lengths and WON'T WORK. My
germicidal bulb cleans off an EPROM in less than two minutes.

>Could someone please tell me the meaning of the digit in UK callsigns.
>(ie which digits have been allocated to Class-A and which to Class-B)
>
Its easy enough:
0,2,3,4 & 5 + 2 letters are class A,
1,6,7,8 & 5 + 3 letters are class B.

class B 5's have not been issued yet.

G series is for current A/B licences
M series is for future use of A/B licences,
2 series is for novice A/B licences.

Just to make it harder the M callsigns will be of a slightly different format,
and 2 callsigns use 2E for England.

There are a few more complications, but you'll discover those in time :-)

For three letter calls (ie 3 letters after the digit) eg G0PUB, GX0RSR
Class A 0 2 3 4
Class B 1 5 6 7 8

> Or is it a lot more complicated than that?
Old 2 letter calls are all class A (eg G5RV)

Novice calls use the same digit..
so 2E0ACY is a class A novice, 2E1AYC is a class B novice
>

Space Shuttle (Endeavour) STS-47
SAREX Operations from
Queensland University of Technology
Kedron Park Campus.

By Andy Joyce vk4kiv,
QUT-KP 23th Sept 1992.
- - - - - - - - - - - -

What follows is a basic overview of the planned SAREX operations with Space Shuttle STS-47 from Queensland University of Technology, and the events for SAREX with the Space Shuttle's full loss of all NASA comms via their TDRS Satellite system.
- - -
On Monday the 14th Sept a project team comprising of Mr Neville Richter lecturer from the School of Computing Science, Faculty of Infomation Technology (FIT), Dr Tee Tang lecturer from the School of Electrical and Electronic Systems Engineering, Faculty of Built Environment and Engineering, plus some project students were present in a FIT computing laboratory at the Gardens Point (city) campus of Queensland University of Technology. A TCP/IP data link (Telnet) was setup between this laboratory and a remote gateway host 10km to the north at the Kedron Park campus of QUT (vk4kiv.qut.edu.au). Also located there was the RF systems for VHF comms to the shuttle, and was manned by myself Andy Joyce vk4kiv.

This unique contact was for full 'converse' keyboard to keyboard comms from the lab at Gardens Point via TCP/IP protocols over the QUT data Network then to be re-sent automatically via AX.25 protocol on the 2m 144-148 MHz Amateur Radio band, where a special set of frequencies was selected for half-duplex comms to and from the shuttle.

As Murphy's Law says.. "A short cut is the longest distance between two points" or "There's never time to do it right, but there's always time to do it over" just about sums up the events on Monday night at our planned AOS time of contact. With NASA on one phone and an audio teleconfence link on another to the lab at Gardens point, NO contact was made !! So after many checks and re-checks we still at this point in time don't know what really went wrong. BUT knowing how much work we put into this, the SAREX team at NASA's Johnson Space Center agreed to slotting us into an unused time slot pass for one last chance for a voice only contact !! Four days later.

On Friday the 18th Sept we had re-setup all comms equipment on an unused Astromony deck at the Kedron Park campus, knowing that the pass with AOS of 08:29 UTC / 6.29pm local would also give us a magnificent opportunity

of viewing the shuttle as it passed over Brisbane, as well as the planned voice comms. ** At approximately 6.20pm local we had the normal phone call from NASA's Johnson Space Center (check for readness of contact) BUT we're told that NASA would like a 'special request' for us to relay to the shuttle that "there has been a major computer malfunction at an uplink site at White Sands New Mexico, losing all comms to and from the shuttle via their TDRS Satellite system" also that "they were looking into the problem" etc... with the Shuttle crew being able to tell MCC what their plans were etc, and averting any possible confusion..... So the next 3-5 minutes was spent relaying by voice, then phone-patching audio from Mission Control Center at the Johnson Space Center, Houston Texas direct to the Shuttle via QUT Kedron Park !! The total down time of NASA's comms system was around 25 minutes, and as it just happened was just prior to our planned contact at QUT !! --> Talk about being at the right place at the right time !!

NASA restored comms with the Shuttle half-way through our pass and then gave us the all clear to go head with our planned operations. Also noting the very BRIGHT pass over are location with a 66 deg Elevation, with full voice comms, made this a very memorable contact to say the very least.

These events again demonstrate the ability of the Amateur Radio Service to providing a wide diversity of Services Supporting Educational Research and real time Communications.

```
re tracking programs. There is one that I know of on a recent
fish disk. Start looking around disk 684 or so, I don't recall
the number since I don't have aquarium here at work so I can't
give the exact number.

re FTP sites...
hubcap.clemson.edu 130.127.8.1 /pub/amiga is a good
place sto start.

or
wuarchive.wustl.edu 128.252.135 /systems/amiga

For general software searches I recommend
getting a copy of aquarium, it is free and
contains documentation of all Fish disks up
to about 690. Search for aquarium.bundle or some
such on the above ftp sites. Includes the program
and the data bases. It will still fit on a
floppy but just.. Since the Fish disks are
up to 730 or so you will need a hard drive
for the next increment of the data base.

(Hmmmm Time for alt.tesla???)

Uhhhh, maybe. The Corum broithers build large (10 foot) Tesla coils.
One of them (Bruce?) is a PhD in EMag, and teaches antenna design.
_he_ found they got best results by modelling the system as a 1/4
wave antenna, or, more specifically, as a helical reosnator. One of his
students built projecty of a 160 MHz "Tesla Coil" with a ~18" wire as
the secondary. As a validation step, Dr Corum plugged in Tesla's
description of his Colorado Springs coil, in its final form, into his
program. He found all the parameters were close to the optimum
predicted for that general design.

(He sells a PC package for Tesla Coil Design.)

If so, then ahalf wave of wire is the place to start, since a half
wave, once "helixed" looks pretty close to a 1/4 wave. (ARRL Handbook,
plans for 180 Meter vertical.) Sombody can run it thru MININEC....

Consider that it as unterminated line, demonstrating "infinite" VSWR...

The "secondary" can be tuned by trimming its lenght, the length of
a non helical section or an elevated capacity. (A spherical elevated
capacity will raise the max voltage, by reducing the corona.)

>A final note: These things can be illegal as hell due to the strong
>signals they emit. Be wary of any interference to licensed radio
>operations. Be especially careful of avoiding MW ship frequencies
>and navigation beacons.

Try Peter Dahl Mfg Co. in El Paso TX (tel 1-915-751-2300). They wind transformers from volts to several kilovolts to your requirements and the pricing is reasonable and fair. That's probably the quickest and most cost effective way. One could be looking for months for a part like that, especially travelling to flea markets, only to find that the item you need isn't available. Also, Dahl will at your request add +/- voltage taps if needed for a nominal extra cost.

>the interface to this particular radio which is what I was looking for.

>First off, the 530S does NOT have a transverter output. The 520S does but
>the 530S does not. I would certainly welcome any mods that I could perform
>to give 530S a transverter output.

>Secondly, attenuators are easy but I was hoping to avoid building one
>to pad down 100+ Watts down to ~200mW. I may not have a choice however.

IF YOU CHECK THE MANUAL YOU WILL SEE ON A MULTI PIN CONNECTOR ON THE
BACK OF THE 530S THERE IS A TRANSVERTER OUTPUT. TO DISABLE THE FINALS,
TURN THE SCREEN GRID VOLTAGE OFF AND THAT WILL KILL THE FINALS.....

CHECK THE MANUAL! THERE IS A TRANSVERTER OUTPUT!!! I'VE SEEN IT!!
THE TRANSVERTER OUTPUT TAKES THE DRIVE OFF THE 12BY7A DRIVER.... IT
IS STILL A LITTLE HIGH, BUT A SMALL ATTENUATOR CAN HANDLE IT. KENWOOD
HAS ALWAYS DESIGNED A TRANSVERTER INTERFACE IN THE TS-520(S), TS-530S,
TS-820(S) AND TS-830S RIGS..... i KNOW, I HAVE OWNED EVERYONE OF THEM
AT ONE TIME OR ANOTHER.... I OWN TWO 830S RIGHT NOW AND THEY HAVE TRANSVERTER
INTERFACES..... SO DO THE 530S.....IF YOU READ THE MANUAL YOU'LL SEE IT!

Mike,

In the real world that is an insignificant statistic since there is no way
to create a filter for it. Once again the sins of a few penalize the many
this is the REAL world.

I support Randall. I managed stores for Radio Shack for 7.5 years, left retail to do software/firmware/manufacturing and developement stuff for 5 years, then came back to retail at Egghead Software. The above advice is as sound now as it was then. Fortunately Egghead is highly computerised, so we can take low numbered checks.

In article <19thr8INNfhb@uwm.edu> retzer@convex.csd.uwm.edu (Joe J Retzer) writes:

I recently purchased a Startek BG-15 frequency counter. I tried to test
its effectiveness with a cordless phone and a CB radio (not MY cb, but
one that belonged to a friend ;-). In any case I'm a little dissapointed.
I could'nt get any reading below about 52 MHZ on the phone (which I assume
is in the 49 MHZ range) and the readings I did get were not stable, implying
that it was not locking onto a frequency.

As for the CB, the results were mixed. About 50% of the time the reading was
close but did not "lock on", ie. fluctuated around the correct reading.
Other times it locked dead on to the correct frequency. I was sitting in
the car with the antenna sticking out the window.

I just bought a Optronics and have been very satisfied with it. I
have noticed, however, that the "range" between the transmitter and
counter is not very great. Sometimes down to a few feet with a
cordless phone (near a running PC: bad RF environment).

I notice that in general the last couple of digits have some jitter
but thats getting down the hertz. The khz digit is rock solid.

My question is:
Is this the best I can expect from a frequency counter?
(this is the first one I've used).

No, you should expect better. Is the range close? Does your unit
have a "speed" adjustment? That would at least slow the rate of
jitter.

Does it sound like there might be a problem with the unit?

if it is not getting down to the frequency it sounds like there might
be a problem. Have you checked the antenna? Close range?

Am I doing something wrong and/or overlooking something?

The Opto has "range" settings. Does yours? Also try playing with the
"gate" control or similar if it has one.

jv

3160. Tesla Coils

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-25 15:11:00 UTC
From: Hugh_E._Wells.El_Segundo@xerox.COM
Message-ID: <"25-Sep-92..8:10:00.PDT".*.Hugh_E._Wells.El_Segundo@Xerox.com>
Source record: 284852

In an earlier post, I indicated that I had built tubed Tesla coils in the past.

More recently, I built several Tesla coils using TV flyback transformers. I used pushpull power transistors operating as a power oscillator to drive the flyback. The technique was to wind on two center tapped coils using #18 enameled copper for the primary and #24-26 enameled copper for the tickler winding. Don't recall the exact number of turns, but believe that the primary was 15 turns CT and the tickler was 20 turns CT. The transistors were operated in common collector to obtain the highest primary coil current. A small amount of forward bias was provided to assist oscillator start-up. I used a 12VDC source for power.

Each experiment resulted in fairly good sparking capability (an inch or better between sharp points) with ample power in the spark. Burning wood and paper with the spark was easy.

Caution must be used when playing with this device as it is DANGEROUS!

On the down side, though, the operating frequency was too low to accommodate skin effect current handling. I learned very quickly that drawing a spark from the flyback with a pencil was a NO-NO! The pencil technique worked well with the tubed Tesla's, however.

3161. Bill Making Scanners Illegal

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-25 15:31:34 UTC
From: teicher@news.weeg.uiowa.edu
Message-ID: <1992Sep25.153134.22999@news.weeg.uiowa.edu>
Source record: 284829

The bill making the manufacture or importation of scanners capable of receiving cellular frequencies illegal is H.R. 1674 - The Federal Communications Authorization Act of 1991. (Reauthorizes and funds the F.C.C). It passed the House (9/24/91) by a 2/3 voice vote under a suspension of the rules.

The provision in question is section 8: Interception of Cellular Telecommunications.

The bill is now before the Seneate Commerce Committee and has probably been assigned to the Communications Subcommittee.

Members of the Subcommittee are: Democrats: Inouye (Chair), Hollings, Ford, Gore, Exon, Kerry (MA), Bentsen, Breaux; Republicans: Packwood, Pressler, Stevens, McCain, Burns, Gorton.

Subcommittee Staff: Antoinette D. Cook, Senior Counsel, 227 Senate Hart Office Bldg., Washington, D.C. 20510-6132, 202-224-9340
Regina Markey Keeney, Minority Senior Counsel, 554 Senate Dirksen Office Bldg, Washington, D.C. 20510-6132, 202-224-1251.

> I've had a few thoughts that I'd like to bounce off the net:
>
> Use the UHF tuner from a TV and phase-lock it to an ovenized crystal.
>
> Find a broken wideband receiver whose VFO still works and use that.
>
> Use the VFO from a scanner. Any idea how modular most radio-shack
> type scanners are? Is the VFO easily extricable?

Two questions leading to a suggestion -
1. What frequency step would be acceptable?
2. What's your technical level of ability?

The suggestion - phase-lock an oscillator to a Direct
Digital Synthesized source. Commonly available DDS chips can do
DC to 20 MHz in .0014 Hz steps - use a divide-by-100 chip in the
loop to get DC to 2GHz in 1.4 Hz steps. (actual VCO performance
may vary. State and local taxes, dealer prep and options extra.)
DDS chip price is around 75 for the DDS, 30 for the D-to-A
converter, add your favorite PLL and VCO and away you go!

>

Sorry, WHEN I was the Electrical Officer, I "owned" the battery.
I presently have access to neither submarine, nor battery (thank god!).

If it makes any difference, there was no concrete in the battery
compartment :-))) There were enormous bus bars, 5 psi air manifolds, an
"explosion proof" fan and bakelite "deckplates" but no concrete.

More: leakage thru traces of acid droplets were a big deal. DC bus ground
readings could get as low as 100k ohm between the DC bus and
ship's hull. Then there would be a battery-well cleanup and the
ground resistance could be brought back up to 2M or so.

3166. Bill Making Scanners Illegal

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-25 16:57:01 UTC
From: teicher@news.weeg.uiowa.edu
Message-ID: <1992Sep25.165701.30780@news.weeg.uiowa.edu>
Source record: 284831

I made a mistake in my previous article. The section number in question is section 9 rather than section 8. (It was section 8 in the House Report that I had). I have included the text of the provision.

From 102d Congress, 1st Sess., H.R. 1674 as transmitted to the Senate.

SEC. 9. INTERCEPTON OF CELLULAR TELECOMMUNICATIONS.

(a) AMENDMENT.-Section 302 of the Communications Act of 1934 (47 U.S.C. 302) is amended by adding the following new subsection:

"(d)(1) INTERCEPTION OF CELLULAR TELECOMMUNICATIONS.-Within 180 days after the date of enactment of the Federal Communications Commission Authorization Act of 1991, the Commission shall prescribe and make effective regulations denying equipment authorization (under part 15 of title 47, Code of Federal Regulations, or any other part of that title) for any scanning receiver that is capable of-

"(A) receiving transmissions in the frequencies allocated to the domestic cellular radio telecommunications service,

"(B) readily being altered by the user to receive transmissions in such frequencies, or

"(C) being equipped with decoders that convert digital cellular transmissions to analog voice audio.
"(2) MANUFACTURE OR IMPORT OF NONCOMPLYING EQUIPMENT.-Beginning one year after the effective date of the regulations adopted pursuant to subsection (a), no receiver having the capabilities described in subparagraph (A), (B), or (C) of paragraph (1) shall be manufactured in the United States or imported for use in the United States.".
(b) EFFECTIVE DATE.-The amendment made by subsection (a) shall take effect on the date of enactment of the Federal Communications Commission Authorization Act of 1991.

The following excerpt from the House Committe Report (H. Rept. 102-207) may be of interest to some of you:

Section 8. Interception of Cellular Telecommunications

The Committee finds that scanning receivers continue to be manufactured with the capability of monitoring the frequencies allocated to cellular telephone service. Such equipment enables users to violate the provisions of the 1986 Electronic Communications Privacy Act (ECPA), which extends Federal privacy protections to cellular telephone users. Equally disturbing, even equipment that
blocks out cellular calls can often be easily modified to receive cellular

transmissions, often by cutting a single wire. Moreover, the Committee has received numerous examples of "how-to" manuals for modifying scanners so that they can be used to eavesdrop on cellular calls. The Committee has obtained copies of advertisements for scanners that do not block out the cellular frequencies or that pitch easy restoration of such frequencies. This amendment is intended to address these ongoing problems, and bring the Commissions certification process in line with ECPA.

Section 8 of the bill amends the Communications Act of 1934 by adding a new subsection (d) to section 302. Subsection 302(d) requires the Commission to promulgate regulations denying equipment authorization under Part 15 (or any other part) of the Commissions rules for any scanning receiver that can (1) receive transmissions in the cellular frequencies; (2) readily be altered to receive such transmissions; or (3) be equipped with a decoder that can convert cellular transmissions to analog voice audio. The bar on scanners equipped with digital-to-analog converters that work in the cellular bands is intended to ensure that the additional privacy protection afforded by the conversion of cellular systems from analog to digital transmission is not undermined. Any question of whether such a receiver complies with the those regulations shall be determined by the Commission.

Subsection 302(d)(2) prohibits the manufacture or importation of scanning receivers with the prohibited capabilities beginning one year after the effective date of the regulations required under subsection 302(d)(1). Subsection 302(d)(2) does not bar the sale or use of non-complying scanning receivers, since the Committee expects that the stock of new non-complying scanners available for sale or use will diminish rapidly once the regulations are adopted. The Committee takes note that this subsection contrasts with subsection 302 (a) and (b), which do bar the sale or use of certain radio frequency devices. As such, the section 510 enforcement powers, which apply to violations of section 302, would not be applicable to scanners other than those manufactured or imported subsequent to adoption of regulations required by this section. Subsection 302(b) applies to scanning receivers only to the extent that they fail to comply with the Commissions rules governing their interference potential.

For a number of years, several manufacturers have blocked voluntarily the reception of cellular frequencies in their scanning receivers. Additionally, some have refused to repair modified equipment that is returned for service, or have restored such equipment to its original configuration. However, methods of converting equipment have been devised and distributed by third parties. The Committee believes that as long as the equipment complies with the Commissions regulations adopted pursuant to subsection 302(d)(1), there shall be no liability under this section for manufacturers due to the actions of third parties.

3167. Periphex NiCad HT batteries

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-25 17:41:28 UTC
From: SHIERY@FULLERTON.EDU
Message-ID: <01GP75RCSE9E000YK1@FULLERTON.EDU>
Source record: 284856

Hello,
Has anyone had a problem with the Periphex brand batteries that are advertied in QST. They claim to sell top quality batteries that are constructed from matched cells.

I bought a BP-84S 18 months ago that has failed. The tech at Periphex told me that there was nothing that I could do to repair this battery and that I should buy another one. He also told me that it was better to quick charge these batteries them to use my slow charger. (Please no debates on charging routines.)

I an not new to NiCad batteries. I have NiCads that I have had for over 5 years; BP-7, BP-8 and BP-8S, that still work. So you can imagine my surprise when my top quality battery from a company made up of hams failed 6 months after the warranty expired. I hope that this is an isolated problem. If so, I will buy another. Periphex's advertising sounds great, so far though my experience is less encouraging.

Thanks
Glen Shiery WD6FMZ

|> at 450MHz and 21cm using helixes and dishes.
The particular project I want this for is actually a professional search on a limited budget. I've been asked by an astrophysics type to help him design and build a system. He's got a very limited budget--hence the search for a cheap-but-adequate solution for the VFO.

I have (not fully tested or tuned up yet) a 21cm radiometer in by backyard in the suburbs of Ottawa, Canada. Doing amateur radio astronomy isn't hard, just time consuming (so what *isn't* these days??). Any sufficiently motivated amateur radio type can do amateur radio astronomy as well.
In fact, any weak-signal VHF or UHF HAM setup can easily be used for radio astronomy. My 2M DX station detects the sun just fine!!

The antennas I'm using for my 21cm radiometer are custom-built (by D.E.M.) 25 element loop yagis; I have a pair of them. My back-end processing system doesn't have quite enough gain yet, but sometime this weekend...

|>
|> stuart@ee.fit.edu

Curious. BNCs are rated at way into the GHz range (same as N, TNC, etc.)
The reason for TNCs is that the threaded connection is more resistant to
extreme vibration, or at least that's the impression I get from the
Amphenol data book.

I don't really understand the point about the solid ground. The ground in
a BNC connector is not provided by the bayonet -- instead, it is in the
springy slotted cylindrical shell surrounding the pin. That shell fits
snugly inside the jack, and is supposed to push against it for a clean
contact and a smooth inner shield surface all the way through the
connector (hence no significant impedance bump). I suppose you can get
el-cheapo sleazy BNCs where this doesn't work well, and BNCs, being so
popular, seem to come in a larger than normal number of varieties, some
totally unreasonable. (For example, why anyone would want to use twist-on
connectors of any kind is beyond me, certainly twist-on variants of such
a basically clean design as the BNC.

So anyway, neither the thread in a threaded connector nor the bayonet in
a bayonet connector (TNC, N, BNC, C, SMA, you name it) is supposed to be
part of the RF circuit. If it acts like it is, I'd call it a defective
part (possibly defective by design).

Of course it has nothing to do with 97.113. The ham was in Australia.

|> and the front panel is painted a light gray semi-gloss instead
|> of the dark gray wrinkle finish usually seen on Collins
|> Eqpt. of this vintage. Would this be a military or commercial
|> version of the 51J4?

Gray? Curious. I have a 51J3. I also have a Collins datasheet for the -4. The -3 and the photos of the -4 show the same finish: black crinkle paint. The labels are part of the paint job (white). I vaguely remember seeing R-380s painted gray, but never 51Js. Could it have been repainted? What do the control labels look like?

|> This set also appears not to have mechanical filters. I thought
|> that the 51J4 like the 75A4 had mechanical filters. Were
|> mechanical filters an option or could the set be special ordered
|> with only a crystal filer?

Something is rotten there. The one feature that distinguishes the -4 is that it has mechanical filters. Do you mean that it has a place to plug them in but they are absent? Or that it doesn't have a place for them? If the latter, then you have a -3 (at best). Still a nice rig, but I'd happily trade mine for a -4...

The crystal filter in the 51J doesn't amount to much; it's a single rock filter. That produces a pointy peak passband shape, not terribly selective either. It's ok for CW, near-useless for phone. Mechanical filters for 51Js show up occasionally, but they aren't common (you need the 500 kHz filters, not the far more common 455 kHz ones). Forget about buying them new; Rockwell is happy to quote them for you but they cost more than a 51J4 in mint condition!

3174. STS-47/SAREX Orbit 92 & QUT

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-25 18:56:29 UTC
From: Andy.Joyce.VK4KIV@mailbox.bison.mb.ca
Message-ID: <717712154.63@mailbox.bison.mb>
Source record: 284753

Organization: Queensland University of Technology

Space Shuttle (Endeavour) STS-47
SAREX Operations from
Queensland University of Technology
Kedron Park Campus.

By Andy Joyce vk4kiv,
QUT-KP 23th Sept 1992.
- - - - - - - - - - - -

What follows is a basic overview of the planned SAREX operations with Space Shuttle STS-47 from Queensland University of Technology, and the events for SAREX with the Space Shuttle's full loss of all NASA comms via their TDRS Satellite system.
- - -
On Monday the 14th Sept a project team comprising of Mr Neville Richter lecturer from the School of Computing Science, Faculty of Infomation Technology (FIT), Dr Tee Tang lecturer from the School of Electrical and Electronic Systems Engineering, Faculty of Built Environment and Engineering, plus some project students were present in a FIT computing laboratory at the Gardens Point (city) campus of Queensland University of Technology. A TCP/IP data link (Telnet) was setup between this laboratory and a remote gateway host 10km to the north at the Kedron Park campus of QUT (vk4kiv.qut.edu.au). Also located there was the RF systems for VHF comms to the shuttle, and was manned by myself Andy Joyce vk4kiv.

This unique contact was for full 'converse' keyboard to keyboard comms from the lab at Gardens Point via TCP/IP protocols over the QUT data Network then to be re-sent automatically via AX.25 protocol on the 2m 144-148 MHz Amateur Radio band, where a special set of frequencies was selected for half-duplex comms to and from the shuttle.

As Murphy's Law says.. "A short cut is the longest distance between two points" or "There's never time to do it right, but there's always time to do it over" just about sums up the events on Monday night at our planned AOS time of contact. With NASA on one phone and an audio teleconfence link on another to the lab at Gardens point, NO contact was made !! So after many checks and re-checks we still at this point in time don't know what really went wrong. BUT knowing how much work we put into this, the SAREX team at NASA's Johnson Space Center agreed to slotting us into an unused time slot pass for one last chance for a voice only contact !! Four days later.

On Friday the 18th Sept we had re-setup all comms equipment on an unused Astromony deck at the Kedron Park campus, knowing that the pass with AOS of 08:29 UTC / 6.29pm local would also give us a magnificent opportunity of viewing the shuttle as it passed over Brisbane, as well as the planned voice comms. ** At approximately 6.20pm local we had the normal phone call from NASA's Johnson Space Center (check for readness of contact) BUT we're told that NASA would like a 'special request' for us to relay to the shuttle that "there has been a major computer malfunction at an uplink site at White Sands New Mexico, losing all comms to and from the shuttle via their TDRS Satellite system" also that "they were looking into the problem" etc... with the Shuttle crew being able to tell MCC what their plans were etc, and averting any possible confusion..... So the next 3-5 minutes was spent relaying by voice, then phone-patching audio from Mission Control Center at the Johnson Space Center, Houston Texas direct to the Shuttle via QUT Kedron Park !! The total down time of NASA's comms system was around 25 minutes, and as it just happened was just prior to our planned contact at QUT !! --> Talk about being at the right place at the right time !!

NASA restored comms with the Shuttle half-way through our pass and then gave us the all clear to go head with our planned operations. Also noting the very BRIGHT pass over are location with a 66 deg Elevation, with full voice comms, made this a very memorable contact to say the very least.

These events again demonstrate the ability of the Amateur Radio Service to providing a wide diversity of Services Supporting Educational Research and real time Communications.

|>others.

I don't agree it violates the ECPA. Since the ECPA amends the act of 1934,
it doesn't seem to violate that act (as amended) either.

The reason I say this is that the ECPA says that it shall be legal to
intercept any communication "readily accessible to the general public".
As you know (and as this CBS broadcast demonstrates) that description
very definitely applies to cellular telephones.

|>I believe the ECPA to be a stupid and misguided effort by cellular
|>manufacturers to give the mistaken impression to cellular customers that
|>their communications are indeed private, and I would like to see it
|>repealed before other frequencies are declared off limits.

Well said!

|>issue. I encourage others who agree to do the same.

Well, I guess I don't agree that it was illegal in the first place, but
even it if it, I don't really understand why you're doing this.
Given your opinion about the ECPA, why would you make a complaint
on the basis of the ECPA?

No, no, a thousand times no.

Your prporsed action will merely make CBS an ally of the cellular phone
companies in their efforts to ban scanners!

IMHO the less the FCC is involved at this point, the better!

3177. Re: Batteries on concrete

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-25 21:27:51 UTC
From: pfowler@hpdmd48.boi.hp.com
Message-ID: <20950027@hpdmd48.boi.hp.com>
Source record: 284755

OK ! I have resisted this battery on concrete thing for weeks and
I can't resist !

My question concerns storage of batteries in the garage. Now I use my
440 mobile and keep the batteries in the front of my truck on the floor.
I have had good sucess with this and have experienced no leaks ... FB !

Now the question ... When not mobile, I store the deep cycle batteries
in my son's little red wagon. When I use them again, I find that the
voltage (and hence capacity I think) is a little lower. My question
is "Am I still safe in a wagon (with rubber wheels) even though the
the wagon wheels are on the concrete floor " ?

I was thinking all was OK until I hear about these little "GRIMLINS".

Is there any chance that these "GRIMLINS" could be responsible for the
dip in voltage ?

3179. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-25 22:36:33 UTC
From: tkelso@afit.af.mil
Message-ID: <1992Sep25.223633.7577@afit.af.mil>
Source record: 284858

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.misc. This week's elements are provided below.

3180. Looking for Collins Manuals

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-26 00:58:10 UTC
From: adam@vermont.nynexst.com
Message-ID: <1992Sep26.005810.15447@nynexst.com>
Source record: 284853
Cross-posted to: rec.radio.swap,rec.radio.amateur.misc

I have a friend who is looking for Collins 75S1 and 35S1 documentation. Schematics are the main objective, but he'd be interested in either owner or service manuals. I believe that there is at least one "commercial" source for this sort of documentation, but I can't remember the details. So, if anybody knows of such a source, or would like to sell him copies or originals, please send email to me at adam@nynexst.com and I'll forward the information.

-Thanx

3181. rsgb gb2rs news 27th sept

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-26 01:18:33 UTC
From: ted@tedb.demon.co.uk
Message-ID: <717487718snx@tedb.demon.co.uk>
Source record: 284849

Good morning. It's Sunday the 27th of September and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- UoSAT 22 helps with hurricane emergency in Hawaii; HF Field Day headlines; City & Guilds fee increase.

From information received from AMSAT-UK Satellite UoSAT22 is providing a great humanitarian service right now in connection with the hurricane disaster in the Hawaiian Islands. It is probable that this is the first time that a PACSAT is being used for Health and Welfare traffic and many messages have been transmitted via UoSAT22 using the HF BBS network. The whole UoSAT team are to be congratulated on this achievement especially when, during the middle of the night, a call to Ron Broadbent, G4AAJ, managed to get the satellite operating again after a breakdown in communication links.

Next the results of the RSGB HF SSB National Field Day which took place during the first weekend last June. The Open Section was won by the Reading and District Amateur Radio Club, G3ULT/P with 5328 points and runner-up was the Plymouth Radio Club, G3PRC/P with 4805 points. The Restricted Section was won by the Gravesend Radio Society, G3GRS/P, with a score of 5121 points, with the Red Dragon Contest Group, GW8GT/P, as runner-up with 4943 points. The QRP Restricted Section was won by the Adur DX Club, G4BUE/P, with 2801 points, with second place going to the Echelford Amateur Radio Society, G3UES/P, with 2556 points. Overall 93 groups entered for the contest. Congratulations to all concerned. The full results will be published in Radio Communication just as soon as space permits.

City and Guilds Centre Registration fees are going up by 100% as from the 1st of October 1992. All Clubs wishing to register as a City and Guilds Examination centres for the Novice Radio Amateur Examination and the Radio Amateur Examination need to get their application requests into City and Guilds before the end of September.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From China, F6FYA and FD1SQM will use the club station BY1BJ on the 2nd, 10th and 31st of October, and also during the CQWW SSB and CW Contests. From Market Reef, members of the DX contest Club OH1AF will sign OH1AF/OJ0 on all Bands and Modes, including WARC, RTTY, 6 metre and OSCAR. Activity to start around the 7th of October for one week. From Marshall Islands, AH6IO and NH6UY will sign V73IO and V73UY respectively from tomorrow, Monday the 28th to Thursday, the 8th of October on all bands from Bikini Atoll. From Sri Lanka, G3VLX hope to be active as 4S7DEG from the 7th to the 31st of October, on 40 to 10 metre bands, but not WARC, using mainly SSB.

Rally news now, and we know of two events for today Sunday the 27th.

The Harlow Amateur Radio Rally is being held at the Harlow Town Sports Centre, Hammarskjold Road, off Fifth Avenue, Harlow. There is easy access off the M11 Motorway at junction 7, the A414. The venue is signposted from this location. Doors open at 10.30am and the event features traders, large bring and buy and special interest groups. There is on-site parking with full facilities for disabled visitors and refreshments will be available. Talk-in by G6UT is on channels S22 and SU22.

The North Wakefield Amateur Radio Club Radio Rally is being held at the Outwood Grange School, Potovens Lane, Outwood, Wakefield. The school is located one mile from Junction 41 of the M1 and M62 Motorways. Doors open at 11am, 10.30am for disabled visitors. The event features trade stands, a bring and buy stall and repeater group and Novice stands. Refreshments are available. Talk-in by G4NOK will be on channel S22.

There are three events for next Sunday the 4th of October.

The Blackwood and District Amateur Radio Society Rally is to be held at the Oakdale Community College, Blackwood, Gwent. Doors will open at 10.30am and the event features traders, a bring and buy. Talk-in is on channel S22. Further details can be obtained from GW0MAW by telephoning 0495 227550.

The Great Lumley Radio Rally will be held at the Community Centre, Great Lumley, Nr Chester-le-Street, County Durham. Doors will open at 11am, 10.30am for disabled visitors. The event features trade stands, a bring and buy, and refreshments will be available. Further details can be obtained from G1JDP by telephoning 091 388 5936.

The Wincanton Radio and Electronics Rally is to be held at the Wincanton Racecourse, Somerset. Doors will open at 10.00am and the event features trade stands, car boot sale and refreshments will be available. Talk-in will be on channel S22. Further details can be obtained from G4YXX by telephoning 074985 432.

HF Contest news now:

During Thursday the 1st of October, the next RSGB QRS Cumulative contests will take place. These events feature slow Morse and further details can be found in July's RadCom.

During next weekend, Saturday the 3rd and Sunday the 4th, the VK-ZL SSB Contest is due to take place. See September RadCom page 14 for further details.

Next the VHF/UHF Contest news:

The next RSGB VHF event is the 144MHz CW Cumulative which runs from 1930 to 2200GMT on Thursday the 1st of October.

During next Saturday the RSGB's 1296MHz Trophy will run between 1400 and 2200GMT.

The RSGB's 432MHz to 24GHz Trophy Contest will take place from 1400GMT on Saturday the 3rd to 1400GMT on Sunday the 4th.

The 2.3GHz Trophy Contest will run between 0800 to 1400GMT on Sunday the 4th. All of the Contest feature a SWL Section. See June RadCom for further details.

Special events

On Thursday the 1st of October REME will celebrate it's 50th Anniversary. To mark the occasion the Arborfield Amateur Radio Club plans to operate the club station from midnight GMT on the 30th of September to midnight GMT on Thursday the 1st of October using the callsign GX3IHH.

Activity on any HF band will centre on frequencies 10kHz above RSARS SSB Net frequencies, and 10kHz below RSARS CW Net frequencies plus/minus QRM. Further details can be obtained from G3ADJ by telephoning 0734 734882.

During Thursday the 1st of October the Houghton-le-Spring Amateur Radio Club will use the callsign GB6HF during their display of the History of Radio at the Kepier Hall, Houghton-le-Spring

Now for some news on repeaters:

Two repeaters have shut down due to the site being sold and redeveloped. The repeaters in question are GB3PE and GB3PB.

And now the solar factual data:

There was a major opening on the two metre band on the evening of the 16th. The panic on the money markets was as nothing, compared to the bedlam which took place when SU1MOZ/P appeared with a 5/9 signal. He apologised for not working the weaker stations, as most of northern Europe were calling him and he had severe interference from stations off the back of his beam. The Tropo opening extended from Spain right across Europe to Poland and up to Norway. Solar activity, as expected, declined and only two small M-type flares were reported. However geomagnetic activity reached storm levels on the 17th but was declining as this bulletin was being prepared on the 21st. For the period 13th to 20th September, spot counts meaned around 98 but varied considerably day to day. Solar flux levels declined over the period and averaged 119 units. The geomagnetic activity started very quiet but, by the 16th, was up to very unsettled levels, with a full storm developing on the 17th reaching an Ap index of 68 units. It was possible that an aurora took place. The period averaged an AP index of 19.5 units. Apart from the flares and magnetic storm the state has been 'nothing to report'. Not surprising the radio quality indices declined to very poor by the 17th due to the magnetic storm, but had recovered to become very good by the 20th, with the Canberra and Tokyo circuits being up to excellent. The aa indices as supplied by the British Geological urvey for the period 8th to 14th September gave a daily average of 45.3 nanoTeslas for the period, but on the 9th was up to 111.8 nanoTeslas with the afternoon auroral peak up to 310 nanoTeslas, equivalent to K7 plus. Bartells rotation 2174 begins on September 27th.

Now the ionospheric data for England and Wales:

Due to a major breakdown at Appleton we have filled in with ionospheric data from Poitiers in France which is on the Greenwich Meridian at 46 degrees north. So the F2 daytime critical frequencies at Slough, as reported by

Appleton for the 11th to 15th, were 7.4MHz and the darkness hour lows 3.0MHz. From Poitiers for the 16th to 20th the highs were 8.8MHz and the lows 3.8MHz.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Irkutsk averaged 6.8MHz, and the darkness hour lows 3.1MHz. Solar cycle 22 is still giving us some surprises. In spite of the recent steep decline, the last solar rotation 1859 gave us 22 M and 3 X type flares, making it the most active rotation since last February, and the 6th of September with 10 M and 2 X flares was the most active day since 7th March 1991.

And lastly the solar forecast:

This week, the more active side of the sun will be coming into view. Solar flux levels are expected to be about the 100s. Geomagnetic activity will possibly reach unsettled levels towards the end of the week. MUFs during daylight are expected to reach 24MHz, and darkness hour lows 21MHz. East west paths should be best on 14MHz around midnight.

And that's the end of the solar information.

Finally in the main news, the licence issuing agency, SSL, has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S L and G7 N Sa series, and Novice calls in the 2 0 A D and 2 1 B C series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Hello, Len!

Not absolutely sure on the "old" military alphabet but here's the new one:

ALPHA
BRAVO
CHARLIE
DELTA
ECHO
FOXTROT
GOLF
HOTEL
INDIA
JULIET
KILO
LIMA
MIKE
NOVEMBER
OSCAR
PAPA
QUEBEC
ROMEO
SIERRA
TANGO
UNIFORM
VICTOR
WHISKY
X-RAY
YANKEE
ZULU

There's half of your answer. <grin>

Got a few things I need:

--Schematics, owner's manual, etc. for this old Hygain crystal-controlled 2m HT. The thing was made around 1977-1978 (acording to Telex/Hygain)... and it's HUGE compared to new synthesized HTs.

--Battery pack(s) for a Kenwood TR-2200 (I think that's the model #)-- it's a "transportable" 2m 12-channel crystal controlled thing. I don't know if it uses standard nicads in a case or not; the batteries that it came with when I got it were just six batteries in a small case but it looked like there was another nicad pack that should have been in there as well.

TNX de N3Never going to get my callsign in the mail!

I forgot something in my last post...I apparently have a burnt-out IC for the amplifier portion of my Hygain HT. Anyone know where to get one? I called Telex/Hygain in Minnesota and Al Caplan told me quite flatly that there are no parts available...it's a 10-pin thing. Please drop me a line.

>
>Let me try and explain this because I think what I said is correct.

I think there's a misunderstanding here.

>First off, yes, there is a 180 degree phase reversal between primary and
>secondary, but this is not what I was refering to.

Nor was I. Any *resonant* coil is exactly 180 *electrical* degrees long.
The two ends of the coil will have their voltages *exactly* 180 degrees
out of phase. With a Tesla secondary, one end is grounded and the other
is left "free". So the potential referenced to ground will always be
greatest at the "free" end, regardless of the physical length of the
wire. The only things that affect what the magnitude of that voltage
will be are the turns ratio between primary and secondary, the Q of
the coil, and the breakdown characteristics of the windings.

> I was talking about the
>voltage standing waves in the secondary, itself. Since this is (ideally) a
>single frequency resonant coil, by using 1/4 wavelength (or some odd
>multiple thereof) you insure that the voltage at the free end is at its
>maximum value, rather than having this maximum appear somewhere else along
>the secondary windings.

The coil is *not* an antenna or transmission line. It's the secondary of
an air core transformer operating at it's *self resonant* frequency. By
definition a self resonant coil is 180 electrical degrees long. Only
if you try to operate the Tesla coil off of it's self resonant frequency
can you have any other voltage distribution. Self resonant coils have a
fixed standing wave with the voltage maxima at the ends. Electrically,
it behaves like a perfectly cut half wave antenna with a very low radiation

resistance. That RL constant can cause a *slight* phase shift across the coil, but varying the physical length of the wire used to wind the coil only affects the *number of turns* you can wind on the coil.

>The 1/4 wavelength secondary is cited by Tesla as a necessary element in
>producing greatest possible arc length in his notes from his Colorado
>Springs experiments, and also in the book "Tesla Coil Secrets" by
>R. A. Ford.

That may be, but remember the state of the art of the time. Tesla didn't have the benefit of modern electrical theory or computer modeling. Nor were his insulating materials very good, wood and cotton wrapped wire, and he was operating his coils excited by spark gaps that weren't spectrally pure. No doubt there were many different frequencies operating in his coils at the same time.

> predicted for that general design.

At the frequencies that Tesla coils are normally operated, LF not VHF, and at the physical size of home Tesla coils, the Rr of the coil is very low. That means it's not much of an antenna. Modeling it as an antenna doesn't make sense as a way to optimize voltage. Instead, it should be modeled as a self resonant step up transformer. At VHF, the coil becomes large relative to a wavelength, the Rr grows, and the doctor's model should be close to the physical realization. Note that Tesla's Colorado Springs coil was extremely large so that it's Rr should have been in agreement with the doctor's model even though it operated at a low frequency. It also blacked out the town because it's excessive current draw burned out the city power system's generator. I don't think home constructors are going to be that exuberant. Modest coils need a different model.

The final voltage output will be a function of the *turns ratio* between primary and secondary and the Q of the coil. A coil with a high Rr will have a *low* Q and a low Q coil will have lower voltage than a high Q coil. So for the highest voltage, you want the coil to be *small* physically relative to the wavelength at which it operates. *Electrically* it will *always* be 180 degrees, or half a wavelength, long as far as the voltage standing wave is concerned. That's by definition of a self resonant coil.

I'd also put forward a thought experiment. Take a 1/4 wavelength wire and wind it into a coil. Now measure it's self resonant frequency. It's no longer the frequency for which you cut the 1/4 wavelength of wire.

It's lower because of the additional inductance created by winding the coil. So you can never have a coil *that has turns* that will be self resonant at the 1/4 wavelength frequency of the straight wire from which the coil is wound. QED.

>cease bothering me with mail I have been ignoring anyway.

>Bob

I admire Bob for the time and committment he has made in producing the
software for the 2232. I am sure that it is the best around. But (and I
have experienced similar "parting of the waters" myself) if (as Bob
describes above) he is no longer having anything to do with AEA, the
implications that he makes about "concerns" are really bothersome to me!

As I said, it is no doubt the best available now, but all the additional
things that we have been asking if the 2232 would be able to handle down
the road are now (IMHO) uncertain. I know that Bob is not the only one
that can program, but having been the sole (I assume) DSP programmer for
the 2232, I would suspect that AEA is going to face a real lag time in
coming up to speed with another programmer that *knows* the code that BOB
WROTE and has equal expertise in this field.

What I am driving at is that I *WAS* going to buy a 2232 (mainly because
I have great faith in Bob's ability). But if he is no longer involved
and does not appear to be doing anything further with it, I am *VERY*
hesitant to invest THAT KIND OF MONEY to what is now an uncertain future.
What if a bug shows up? What if whomever follows Bob on this project
decides to "improve" on things? In other words, I would no doubt buy the
2232 if the author of the code was continuing to improve it. But I have
seen too many cases where a company develops something, then the
person(s) that develop that something for said company somehow get
"stirred up" and in the company's reorganization effort for said
development, chaos results. This would certainly scare me!

Now, the question is (and Bob your input is welcome - though not solicited
:-)), does one buy the 2232 or should I now (forbid) go with the
L.L.Grace DSP-12 ? It is cheaper (and maybe inferior), but at this point,

I feel probably has a more certain future (or maybe I should
say consistent).

I don't know. I am asking for your thoughts. I don't have the money
for either units to "blow", so my invstment must be the wisest one! Any
input would be greatly appreciated!

Bob, sorry things turned sour. Thanks for what you did manage to get
done! I am sorry to see you off the project.

73's,

Mark

[Note: I posted this about a week ago, but due to an incorrect
Distribution header on the original message (it was set to
"rec.radio.amateur.misc") it never propogated out.]

Hi Joe, welcome to the net, with all its benefits and foibles! If
you've meant this one somewhat tongue-in-cheek, I apologize for taking
it "too seriously." However, as others in the group will attest to, I
like to take the group down "memory lane" with a little summary of our
history and motivations every once in a while.

This basic idea has been argued many times, both in informal debate, and
in the last newsgroup reorganization, condected by Jay Maynard. The main
criticism would of course be that simply making heirarchies is no
guarantee that people will compartmentalize their thoughts to specific
newsgroups (cross-posting and "take this to **** subgroup" arguments
will abound). We have enough trouble distinguishing between *.misc and
*.policy.

If the real reason is that you personally (or a small group of your
colleagues) don't want to read certain subjects, you might want to try
kill files, which can filter subject keywords and individuals (heck, I'm
probably in a few kill files! :-) I would highly recommend the rn or nn
newsreaders for their ease-of-use, format of presentation, and kill
features.

There are also a few more subtle criticisms, which I will note below.

> .technical - This group would be for the discussion of real
> tube/transistor and coil kind of stuff. Projects,
> antennae, RFI, propogation and such might be examples
> of relavent topics.

Let's not forget Brian Kantor. He gateways this newsgroup to Info-Hams
(and *.packet to Packet-Radio and *.policy to Ham-Policy). When the
last reorganization was discussed, he made it clear that he would only
be gatewaying ONE main newsgroup (which is certainly his right, as it
makes his administration simpler) and would probably arbitrarily choose
between misc or tech (correct me if I'm wrong, Brian).

> .consumer - This group is for the "What do you think of ...'s rig" or
> "Where can I find a manual for a ..." or "Has anyone had
> problems mounting a ... in a ..."

I don't see how this one can be detangled from .technical, as many of
these are basic tech questions.

> .bulletin - Here is where all the automatically forewarded ARRL stuff,
> DX reports, Solar info, and Special event/contest messages
> would go.

There was a discussion of a rec.radio.info or rec.radio.announce
newsgroup which would be "self-moderated" such as with news.answers
or rec.music info. It was shot down the last time it was suggested,
but it might be worth resurrecting again.

> .ragchew - This will be the largest of the news groups and one I will
> not read ;-) . Here is where you put all your frustrations,
> BS, and ham related tidbits that really are not appropriate
> to any of the other boards.

Seems like a waste, sort of a default newsgroup to add to the
cross-posting line. Again, you're revealing that your underlying desire
for such a newsgroup as a pre-fab kill file.

>Now if we could only get some sense of order in the world of packet!

Watch for an updated Packet FAQ. You might also want to check some of
the speciality packet mailing lists (such as for gateways and TCP/IP)
mentioned in the FAQ.

> Thank you for the soap box,

Most of your ideas have been suggested before, and have been declined.
Nevertheless, I would never try to stand in the way of someone
initiating a formal newsgroup creation proceeding (with a Call for
Discussion and Call for Vote). Check out news.announce.newusers for
offical instructions. (Although informal debate like this is certainly
meaningful, in the Usenet sense, it "doesn't count").

Remember, this is just *MY* opinion.....

[Note: I posted this about a week ago, but due to an incorrect Distribution header on the original message (it was set to "rec.radio.amateur.misc") it never propogated out.]

No, just us net control freaks. :-)

I wouldn't mind co-moderating a bulletin and FAQ-oriented newsgroup such as rec.radio.announce or rec.radio.info (similar in setup and function to news.answers). Naturally, this would have to be acceptable to a majority of the net (I have my detractors) and I would prefer if it rotated among several guest editors (such as with alt.comp.acad-freedom.news).

Any other volunteers?

SB DX @ ALLBBS $RTDX0925
RTTY DX Notes 25 September
RTTY DX Notes for week ending 25 September, 1992 (BID RTDX0925)

Some bad news to begin. Christian, FY5AN (Former FY7AN), became
Silent Key last Saturday the 19th when he fell from a tree. Our
deepest condolences to his family.

Syd, VK2SG is again in the hospital as the specialist wanted him
immediately. We are not sure how long he will be there. We all wish
a prompt return home.

While waiting, have fun this weekend in the CQWW RTTY Contest from
0000Z, Saturday 26 til 2400Z Sunday 27. RST, State (FOR USA), CQ
Zone.

Our thanks this week go to VK2SG, VK2EG, TG9VT, I5ICY, IK5AAX, DJ3IW
and the Central European DX Cluster, AA5AU, NT3B, KE5GA, WB2CJL, W2JGR
and the Twin Cities DX Packet Cluster Network. Thank you all for the
cooperation and assistance.

Jacques, FR5ZU/E showed up on schedule from Europa where he will stay til October 4. Will move then to Juan de Nova from October 5-16.

Jim Smith, VK9NS will sign VK9WW from Willis Island for a week between October 7-14 and he promises RTTY.

Don, AA5AU with G0AZT, KP2N and N0FMR will activate P40RY, Aruba, starting Thurs Sept 24 with main focus of this trip the CQWW RTTY Contest.

A group from Northern California will operate from Christmas Island, IOTA OC-024 from Sept 23-28, including CQWW RTTY Test.

Bob ZL4DO has been again active from Kermadec as ZL8RS, but no RTTY. Little time for radio. We hope for the next visit.

Good news on Ghana, 9G. The ban on amateur radio activity will be lifted 15 January 1993. They will revert to civilian rule.

>From October 21st the Slovenia hams will use a new prefix (S5).

GL DE (DX2) I5FLN AT TG9VT.GTM.NA

> Pretty soon, there won't be anything *but* 2 by 3 calls and they'll
> start issuing *those* to extras.....Maybe then something will get done about
> this insufficient callsign problem.....ya think?

Didn't the whizz kids at FCC bring this on themselves when they designed
incentive licensing calls that gave more emphasis to *license class*
than chronology or geographic call area? Don't know how many new hams
we have in our club who have never been on the air yet, but have gone
through 2 or 3 callsigns already "...cause I gotta me one of them *good*
sets of numbers....". And I bet that attitude is more common than not
across the country.

--WB5FBS (yep, another of those 2 by 3 calls!)

You didn't tell us how it failed so no further comment there. My
Periphex carfone battery is working fine two years hence. I DO
quickcharge it and never trickle charge. Perhaps you should listen
to their tech.

3197. Swarthmore Amateur Club Reborn

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-26 22:40:37 UTC
From: sweiler1@cc.swarthmore.edu
Message-ID: <X41QB133@cc.swarthmore.edu>
Source record: 284871

We're back! Swarthmore College, Swarthmore, Pennsylvania has restarted its ancient amateur radio club. With a membership of four (and rising daily) and permanent college stations operating on HF, 2 meters, and 70 cm, we are quickly coming coming back to life. I send this as an announcement of our group, but welcome any comments from similar college groups. For now, you may post here or contact KD4KHY Samuel Weiler '96 <sweiler1@cc.swarthmore.edu>

3198. Request for Logging Program

Newsgroup: rec.radio.amateur.misc

for sale:

computer systems:

1) atari 800XL $ 250.00
1050 diskdrive
1030 modem
tons of software
tons of documentation
atari 2600 game
all the cartridges

2) commodore 128/64 $200.00
1571 diskdrive
tons of software
tons of documentation

3) H.P. 150 touchscreen $250.00
built in terminal
640K ram (expandable to 1Meg)
2 - 3.5" floppy drives
P.A.M. operating system
ms dos 2.1 for H.P. touchscreens
applications and software

4) 2 each digital pdp 11/34 computers $500.00 for 1
700.00 for both.
(if you buy both for $1,200.00, all of the perriferals are included,
including disks, tapes, terminals, printers, diskdrives, boards,
cables, powersupplies and racks) *

5) 1 each digital pdp 11/23 computer $700.00
(with 2 harddrives, in 1/2 size rack - plug and load)
(for $500.00, all perriferals will be included as outlined
above) *

6) 6 harddrives, (could be used with either of the pdp configurations)
(including 2 - c3d 660Meg removable media harddrives)
4 + tapedrives
tons of disks
tons of tapes
tons of documentation
tons of extra boards
decwriter III
decprinter II

terminals (various states)
modems (at least three)
extra boards
other equipment....
all cables available

(i will break up some stuff, but not the atari, commodore or pdp 11/23
systems. i will add to them in any configuration that is reasonable)

i *MUST* get this stuff *OUT* of my garage, *immediately*!
i am amenable to trades, but have very specific needs. all items
can be shipped except the large systems. shipping in NOT included
in the price, and (due to the fact that i have been burned twice, now)
payment is certified before delivery. delivery is the responsibility of
the purchaser.

if you are interested, you may contact me at the addressses in my sig.
please designate the subject as 're.: computers for sale', otherwise i
may not get bact to you as quickly. all items will go on a 1st come,
1st served basis, and purchasers of complete systems will be considered
over partial pieces.

and, as always, i am/at:

| | | $ | $ || $ xfrmr * RESPONSIBILITY FOR *
| ^ | | $ | $ || $ * YOUR USE OR ABUSE *
2N3055 |/ | | $ | $ || $ * OF THIS CIRCUIT!!! *
+--------| | | | | $ || $ * *
| |\ | | | | | || $ ******** DANGER *******
| | \ | | | | | |
| +--|------|--+ | | +------o 1 8 - 5 Pin connections
+--------------|------|-------|--+ +-----o 8 7 5 4 to the following
| | | +----o 5 6 6 2 flyback
| | | +---o 7 4 8 1 transformers:
| | | | | | | +-- 738192
+------|-------|-----------| | | +----- 32-10008-4
|27 ohm|240 ohm| | | +-------- 32-10014-1
+--R1--+---R2--+ | +----------- 32-8859
| | -----
| | /////
- 12 volts +
```

Quoting from the instructions:

"WE TAKE NO RESPONSIBILITY FOR YOUR ACTIONS!!!

The new windings must be added to the flyback transformer to allow
adequate transistor drive capability. These windings are hand wound
on the bottom leg of the ferrite core where the original filament
winding was located. Remove and discard the original filament winding.
In its place, wind first a ten turn, center-tapped, winding using
approximately 30 inches of #20 or larger hookup wire. This is easily
accomplished by winding five turns at one end of the core and then
twisting a loop in the free end before adding the second five turns.
The complete ten-turn winding should then be held in place with a turn
or two of electrical tape with the two ends and the center loop all

protruding. Connection can be made to the center loop when the insulation has been carefully removed. If it becomes necessary to cut the center loop, be sure that the two ends are scraped and joined to form a mechanical as well as an electrical center-tap to the winding. [L2 in my drawing]

"The second winding should be wound directly on top of the first but it should only have a total of four turns--two each side of the center-tap. Again, wind two turns of #20 or larger hookup wire, pull and twist a center loop, and wind the other two turns. Tape this winding in place on top of the first. Do not let the center taps of two windings touch each other but they should not be more than one quarter of an inch apart. [L1 in my drawing]

"Wire the modified transformer to the transistors and the bias circuit resistors as indicated on the schematic circuit diagram. Be sure to mount the transistors on a suitable heat sink with the insulating hardware provided to protect them from over heating. Since the collector connection of these transistors is made to the case, it is necessary to keep them electrically isolated from one another and from the heat sink and insulators are provided to allow this. Heat sink area of approximately 25 square inches should be adequate. If, however, the power transistors become too hot to hold a finger on, more heat sink area should be provided. Heat sink material of one-eighth inch aluminum is desirable.

"Note: If Oscillation does not start Immediately Interchange the two Transistor Base connections [capitalization as in original!]

"CAUTION: LETHAL VOLTAGES ARE INHERENT IN THIS DEVICE. EXTREME CAUTION MUST BE EXERCISED TO KEEP THE FULL OUTPUT OF THIS DEVICE FROM BEING APPLIED LIMB-TO-LIMB OF ANY LIVING ANIMAL. SEVERE BURNS OR DEATH MAY RESULT FROM CONTACT WITH THE FULL OUTPUT..."

There were other instructions about how much damage might accrue to a human if contact were made to the high-voltage output, so BE CAREFUL!

I used one-half watt resistors for R1 (27 ohms) and R2 (240 ohms) and got a nice Jacob's ladder effect. It also wiped out most of the computer terminals in the entire building, so I couldn't run it very much! I later tried 18 volts and one resistor zapped immediately!

>The reason I say this is that the ECPA says that it shall be legal to
>intercept any communication "readily accessible to the general public".
>As you know (and as this CBS broadcast demonstrates) that description
>very definitely applies to cellular telephones.
>
I wish that WERE true Paul, but the ECPA (Electronic Communications Privacy Act) of 1986 was an ineffective and self-serving law which was coerced by the Cellular Telecommunications Industry Association (CTIA) to enable cellular manufacturers to give the illusion of privacy to cellular customers. The fact is that cellular transmissions are specifically "protected" under the law (while cordless phones are not given such protection).

That same CTIA is the organization which is pressing congress to make it illegal to sell radios to the public which are capable of receiving cellular frequencies, or restorable to do the same... but that's another thread. Norman Black, spokesman for the CTIA is trying to step up the pressure on congress by releasing news stories to the AP which refer to persons who receive cellular frequencies as "techno-creeps".

Why press the issue about CBS? Because a few years ago an individual recorded the cellular conversation of a local politician and his girlfriend. The recording ended up in the hands of local news media and was broadcast. The FBI was called in to locate the perpetrator of the crime, and a person was charged with violation of ECPA and wiretap laws. CBS did EXACTLY the same thing in their recent story on 48 hours, except no malice was intended. But malice is not required to violate either law. As I see it, if the FCC charges CBS and its affiliates, this will place CBS (reluctantly) in a position where its high-priced lawyers will have to fight the ECPA law... they CAN'T afford to allow their affiliates to take one like this on the chin because of THEIR blunder of allowing it on the air.

Will the ECPA and future frequency restrictions just go away if we close our eyes and ignore the situation? NOT

So send your letter to the FCC demanding action on this violation.

I was told that quickcharging W2A nicads degrades them; hence I've
been slow charging mine with the ICOM charger (15 hours for a full
charge) immediately after my radio starts beeping (indicating
incipient battery failure). Is this the best way to use this battery?
--
Dave Feustel N9MYI <feustel@netcom.com>

The current epidemic of violent crime in the U.S. arises not from drug
use, but as a consequence of government-sponsored oppression of
producers, distributors and consumers of popular drugs not produced by
(and hence threatening the market share of) the alcohol, tobacco or
pharmacutical industries (which industries, coincidentally, are the
largest contributors to the Bush Reelection Campaign and the biggest
underwriters of antidrug advertisements (which advertisements,
coincidentally, never mention tobacco or alcohol as dangerous drugs)).

I recently purchased the 12V 800 mA PB8S (For kenwood th-77a), I have
been pleased with the battery, except when first recieved, the case for
the battery was flimsy, and came right apart. I had to tape the case
until I got some good glue, and finally got the case to stay together.
Since then, OK so far!
-Ted

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* NEW MICROSAT FOR 1992 *
=========================
A new Microsat-class OSCAR satellite is planned for launch before the
end of 1992. UNAMSAT-1, the first Mexican Amateur satellite is being
constructed at UNAM, the Autonomuous University of Mexico. As with
the earlier Microsats it will have five modules, each about 20 cm
on a side. Four of the five modules are updated clones of existing
Microsat hardware/software:

- Dual 70cm PSK transmitters (design by YT3MV)
- V40 CPU (designed by WA7GXD and others from TAPR, with
modifications by I2KBD and ITAMSAT)
- Power system with BCR (by KE3Z/ARRL) and batteries
- 5-channel 2-meter FSK receiver (by W3IWI)
- Similar software to other Microsats (by NK6K and G0/K8KA)
- AART Bus architecture (by W3IWI and N5BRG)

The main differences from the earlier Microsat configuration are:

- The V40 CPU will have 4 MB of bulk RAM (vs. 8 MB).
- UNAMSAT-1 will be equipped with Gallium Arsenide solar panels
(vs. the BSFR technology flown on the Microsats).

The innovative new addition in UNAMSAT-1 is the brand new on-board
experiment in the 5th "TSFR" ("This Space For Rent") module.
UNAMSAT-1 will act as a meteor sounder. It will contain a 40.097 MHz
transmitter with 60 watts output during pulses from which can be varied
from 1 to 10 msec in duration and with a pulse repetition rate of 1
to 10 seconds, as controlled by a 68HC05 CPU. The meteor echoes will
be detected on a receiver at the same frequency designed to detect the
returned echo and measure its doppler shift. The use of the meteor
sounder is to obtain research data on the full-sky spatial and velocity
distribution of meteors, with the focus on a search for high-velocity

meteors originating outside our solar system.

The 41 MHz frequency for this transmitter is in the accordance with the ITU frequency allocations table for scientific research and both the 41 MHz and amateur frequencies have been licensed by Mexican authorities. The transmitter has a crystal frequency controlled exciter and a class "E" power amplifier.

The meteor receiver is an SSB "zero-IF" design (suggested by W3IWI) and the return echoes are digitized and stored in the normal V40 Microsat computer's RAM. After each pulse, the spectrum of the received signal will be determined using the onboard V40 as a DSP Fourier Transform spectrum analyzer. If a meteor echo is detected, the echo will be saved for later transmission as a special telemetry frame.

The 1-10 second repetition rate for the meteor transmitter will be adjusted depending on the state of charge of the batteries and other spacecraft power requirements, and also on the time domain requirements of the echoes.

Detailed telemetry formats for meteor "radar" are still being defined. Data will be sent using standard amateur AX.25 packet specifications.

When UNAMSAT-1 is not involved in meteor research, it can be turned into a standard PACSAT message store-and-forward satellite.

Also still to be finalized are the detailed 2-meter uplink and 70-cm downlink amateur frequencies.

XE1TU has been responsible for technical development of UNAMSAT-1 along with the team of hams and students at the University. The hams are XE1MGI, XE1XUS, XE1YLS in Mexico City. Scientific direction for the project has been provided by UNAM Professor of Astronomy Arcadio Poveda. AMSAT-NA provided technical details of its Microsat satellites to UNAM. During the development of UNAMSAT-1, technical assistance from AMSAT-NA has been provided by W3GEY, N4HY, NK6K, W3IWI and WD4FAB. ITAMSAT assistance was coordinated through I2KBD.

The UNAMSAT-1 launch will also be the beginning of a new era. Along with a larger meterological satellite, it will be launched by the Russian Space Agency and by the Russian Academy of Sciences on a decommissioned SS-18 ICBM into an orbit about 1000 km high. At this time the launch is scheduled for the first week in December, 1992. Details for the launch are being worked out at the present and will be made available as soon as possible.

[Info via W3IWI]

* SHUTTLE O-RING PROBLEM *
==========
For the first time since the Challenger disaster in 1986,
NASA has found a leaking O-ring seal on a solid rocket
booster being readied for shuttle launch.

The leak was discovered last week during a test on motors
intended for Discovery's liftoff in November, the space
agency said Tuesday in Cape Canaveral, Florida.

A failure in such a rubber seal was responsible for the 1986
explosion that destroyed Challenger shortly after takeoff,
killing the seven astronauts aboard. Since then, the seal has
been redesigned and an extra O-ring added. Orings seal off
joints in the boosters.

The right booster will be taken apart and given new O-rings,
and should be reassembled by the end of next week, said NASA
project engineer Philip Weber. Officials said they did not
know if the leak would affect the launch.

3208. Re: Finally!!! History of the word "HAM"

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-27 05:12:30 UTC
From: davros@ccwf.cc.utexas.edu
Message-ID: <80544@ut-emx.uucp>
Source record: 284784

I have heard umpty-billion different theories on this, the most recent of which has something to do with HAM being the first letters of the names of three early Amateurs who had a station in some time in the distant mists of Time. Anyhow, I think it was their first names; they started with the first three letters of each name for the call letters of their station, but they got confused with some ship or another so they shortened it to HAM. Well, I never finished reading that article--someone snailed it to me, and I think I even still have it (underneath something--very likely under my bed where everything ends up ...) Anyhow ... was, according to this theory, the call of this station run by these three people whose names I forget and I can't seem to find the article right now. If anyone is really interested, I'll look for it and post if I find it.

Hello.

Thank you for the concise summary of the history of "rec.radio.amateur.misc".
I was a kibutzer for the last newsgroup reogranization; IMHO not much has changed
which would merit a further reorganization.

However, how does this hierarchical structure of the ham radio interest
newsgroups square with the notice I just received of the creation of a new
newsgroup "rec.ham.radio.swap" or some such? If this a dumb question, sorry.
I just gained access to Usenet after a long absence.

Thanks.

>companies in their efforts to ban scanners!

Not likely. The news media is heavily dependent on the illegal use of scanners to further their business interests. It's in their interest to get the law changed, but they haven't worked at it because the FCC has been giving them a pass. It's time they see this law as goring their ox.

>IMHO the less the FCC is involved at this point, the better!

The FCC has tried to dance around this issue because they know it is bad law. The US Attorny's offices have also tried to avoid prosecutions under the ECPA because they also recognize it as bad law that would likely fail a Supreme Court challenge. Now individuals with scanners don't have the resources to push such a case, but the media does. Forcing them to come to terms with their own illegal activities is a good way to push this issue before the Supremes. Note that even laws that are unenforced have a chilling effect on manufacturers who don't want to expose themselves to possible legal sanctions. So it's a good idea to push this issue to a resolution if we want to see unfettered manufacture of scanners.

Checkout the Collins "collectors" net on 14263 (+/-) on Sunday afternoons (1600 East Coast time). As told to me "Cant find it there, or get a lead there, it don't exist".

3213. Re: JOTA

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-27 14:23:25 UTC
From: geertj@ica.philips.nl
Message-ID: <1992Sep27.142325.18394@ica.philips.nl>
Source record: 284791

With JOTA coming up, it might be a nice idea to make a poll on what JOTA does in different countries these days.

For instance, since a couple of years, it is allowed to have scouts behind the microphone in Holland: a licensed ham builds the QSO (CQ, I, etc), and then gives the microphone to the scout. At the end of the QSO, the ham closes the QSO again. He checks the transmissions, helps and must stand by during the whole QSO, but can leave the QSO itself to the people who want to make them.

We have most success with FM on 2 meters. SSB just sounds too weird for most scouts, and of course there is a language barrier (while all Dutch learn English at school, actually using it is a different thing!)
The audio quality of FM makes QSO's that are enjoyable and easy to understand for all (even then, we still use headphones exclusively to make the audio better. really helps!)

JOTA seems to be enjoyed by all. Some scouts just use JOTA as an excuse to build huge masts (of rope and wood, of course), while others find using radio most enjoyable.

Soo.. as a preparation for this year's JOTA, let's start a discussion on:
- Your experiences
- What is allowed in other countries? I heard that some countries do not allow scouts behind the microphone at all. (actually, for some years the British only allowed QSO with other British or the colonies. It just happened that one of the scouts just moved from Britain to Holland two years ago; can you believe the pile-up we had?)
- Ideas, hints?
- Callsigns?

We will be operating using PA0KLS/J during the weekend. Hope to work you!

3214. Re: Periphex NiCad HT batteries

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-27 15:17:58 UTC
From: ron@topaz.bds.com
Message-ID: <1a4jb6INN795@topaz.bds.com>
Source record: 284796

I've got three Periphex batteries for my Yaesu FT-470. I always use the new Yaesu charger to charge them, before than I used a scummy NOVEX (read EEB) charger on them. While the NOVEX cooked my real YAESU batteries, the Periphex batteries survived. I always rapid charge them (I broke the plug on my wall charger).

A properly designed rapid charger shouldn't damage the batteries. The major issue is heat that builds up after the batteries are fully fed. The advantage of a slow charger is that the heat is dissapated (which is why you can leave it unattended by timers or other sensors). Draining nicads bone dry is much more damanging than charging behavior. My philosophy is to have a spare battery, switch batteries when when the low battery indication comes on and then drop the depleted one into the rapid charger.

It's worked for both my radios and by cordless drill.

-Ron

>
> Any suggestions would be helpful.

The DJ-580 has provisions for remote control thru the external speaker jack; Alinco sells a mike that has the up/down buttons and mem/VFO on it. The speaker plug is a three-conductor type (stereo), and by varying the resistance from (I believe) sleeve and ring, you can activate different functions on the radio.

You can't simply sweep the resistance and see what it does; each resistance has to be preceeded by either an open or short circuit; I don't remember which. (A friend of mine told me about this a week or two ago... details are foggy.)

In any case, a partial contact on the ring connector is what's causing your radio to QSY; and that's consistent with what you said was happening.

3216. Re: Telsa Coils

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-27 15:49:58 UTC
From: regnad@hal.gnu.ai.mit.edu
Message-ID: <1992Sep27.154958.4091@mintaka.lcs.mit.edu>
Source record: 284792

The truth is, there was always something about the 1/4 wavelength of the secondary that I wasn't comfortable with. When I first heard about it I thought that it didn't really make sense. But after hearing it being cited time after time, as well as by Tesla himself, I decided to accept it. One of the more difficult aspects of the Tesla coil to fathom (for me) is that the voltage available at the free end is greater than what would be predicted by the turns ratio. I chalked that up to the resonant nature of the system, and that added support to the 1/4 wavelength concept. I have also thought about the fact that the resonance of a given length of wire in space should not be the same as the same length of wire wound into a coil. But a coil also has a distrubuted capacitance, due to the adjacent turns being more or less parallel. I thought perhaps (without resorting to any calculations) that some combination of L and C brought about by the physical dimensions of the coil would make the 1/4 wavelength concept valid.
I guess I still need to look into the matter further, and this time pull out my calculator. :)

> I could'nt get any reading below about 52 MHZ on the phone (which I assume
> is in the 49 MHZ range) and the readings I did get were not stable, implying
> that it was not locking onto a frequency.

There may be two problems in trying to read the phone. Some older models used 49 MHz one way, and lower HF (1.7 MHz on some) for the other channel. Also, the power levels are extremely low (a couple of milliwatts), so if you had an antenna on the counter and were holding it next to the unit, you simply may not have had enough signal to trip the counter.

A far better way is to use a probe and clip onto the antenna for these low power applications. But, you need to be careful that you aren't hooking onto a receive antenna... the systems that use 49/1.7 MHz generally have the hand unit TX on 49 and the base TX on 1.7; the whip on the base unit is a receive only antenna; the 1.7 MHz RF is often coupled to the AC house wiring.

In any case, if there is a strong signal in the area, you may be reading some combination of the signals... that can be a real head scratcher when trying to troubleshoot a rig.

Either someone made a mistake, or is being a retrograde idiot
by denying the legitimacy of the last reorg.

Giving them the benefit of the doubt then ,if it's a nearby
site, a voice phone call or polite email telling them of the
reorganization and the new names would be the first step.

And using the facilities in news to alias it to the new name
(rec.radio.swap), would be a good second step.

And if they are being a retrograde idiot, about the only
thing to do is the standard Usenet enforcement of gathering
together an electronic mob and chasing the perpetrator through
the network, pitchforks and torches held high. ;-)

U2MIR?
>Thanks for the help! KF9DU - Tainter Lake.

The current callsign on MIR is U6MIR (as of a 9/17/92 the last time I
copied it, during the Shuttle flight).

You can get satellite orbital elements here, or directly from the
Celestial BBS which can be dialed into. One of the last 50 messages
(I know because my local BBS only lets me have 50 at a time!) has the
latest elements PLUS the telephone number and vital statistics for this
BBS. I usually download them on the SPACE Roundtable on GEnie once a
week and feed them to my tracking programs (QuikTrak 4.0 and TRAKSAT).

There's even a "stripper" program available on GEnie to remove everything
except the stuff the tracking programs need. Works well....if you're
serious about this stuff, may I recommend you get a math coprocessor chip
as it really speeds things up! Best of luck, 73,

What you pr'y have is some kind of intermittent on the speaker mic cable. The Alinco has the capability of operating with a remote control speaker mic, which has a VFO/Mem button, along with up and down. So if you switch between vfo and mem or are having problems with it going up or down, that's bound to be it.

I've got the mic with the buttons, and FL doesn't lock out those controls. It has a separate lock switch on the back of the mic...So it's useful if the radio is in a pocket or on a bumped belt but I still want to switch freqs...

I believe the control signal is on the mic plug, which is a mini stereo type, so maybe if you see what you can do on that end...maybe a new plug on the mic or something?

A reminder to all that the American Radio Relay League
continues to make available to Amateur Radio Operators and
non-amateurs alike a wide variety of free materials and
services. Of particular interest to the not-yet-licensed
individual would be the ARRL Prospective Ham Package. In
the PHP, one would find:
-
1. Printouts of Volunteer Examination session
opportunities in his/her area.
-
2. Listings of Amateur Radio clubs in his location.
-
3. Helpful promotional material about the Amateur Radio
Service.
-
The already-licensed individual might well be interested
in another free ARRL publication, the ARRL Public Service
Communications Manual. The PSCM represents the "bible" of
public service communications, and clearly/concisely
points out how the ARRL National Traffic System and the
ARRL Amateur Radio Emergency Service function as a
cohesive unit to provide the maximum support to the public
both in times of disaster as well as "normal" times.
-
To obtain either of these free ARRL services, please
provide me with:
-
A. Your name
B. Your mailing address
C. A Specific request for either of the two services
above.
-
Best 73!
-

3225. Kenwood TH78A Review

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-28 02:42:34 UTC
From: bruno@athena.mcrcim.mcgill.edu
Message-ID: <1992Sep28.024234.5385@thunder.mcrcim.mcgill.edu>
Source record: 284799

I'm posting this for a friend, who, it appears, can't get his
news-poster to cooperate.

I've recently bought a TH78A from kenwood, and as I did not see a
definite review about it, I'll write one now.

First I have to say that I had a ICW2A and the TH78 is definetely
superior, smaller and contrary to the W2A it does receive above
450Mhz.
Aside : if you want to make any W2A owner mad just tune your
TH78,FT470 to a station one Mhz or so above 450Mhz, I promess you that
they will be pretty upset when they try it on their rig. :-)

Best points:

- Compact , It the smallest dual band that I saw with a 7.2v
700mAh battery.
- 50 memories standard and 252 memories for only $20 more with
the possibility of storing/retreaving the repeater location
or call sign with the frequency.
- Real extended RX/TX with simple mod :
RX 118-136 AM
RX 136-180 FM TX 136~167
RX 300-400 FM (not completely working)
RX 400-512 FM TX 400~495
RX 800-950 FM
The sensitivity is excellent on all bands.
- Full 5W repeater feature with excellent audio between any
two
bands. (good for emergency/rescue situations) (requires
simple mod).
- audio routing of each band to internal/external speaker.
- Simultaneos receive of two indipendant frequencies in the
same band.
- fully digital volume level with programmable dials.
- Two VFO per band for a total of 8 VFOs.

worst points:

- Difficult access/use of side keys especially the autodial
memories (10)
- Annoying front keypad door. (can be easily removed)
- Minor bug in the rom. (it doesn't save the VFO CTCSS state
when powered down)
- Intermod : it's excellent for ht use , but it won't work

with
an external antenna or mobile installation.

I hope this will help all the undecided hams out there.
You will find some of the mods in anonymous ftp @
capella.eetech.mcgill.ca
in /ftp/pub/ft470/mods/th78.
I would really like to have more information on hidden features, or
the full mods instruction.
Thank you.

73's
Luca

3228. IC-735 Scanning Abnormality

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-28 10:16:29 UTC
From: ws1c.UUCP%rocky.dnet@ws1c.UUCP
Message-ID: <199209290015.AA24311@harvey.gte.com>
Source record: 284750

My IC-735, still under warranty, has picked up the strange habit of starting scanning from 14.0 MHz in the vfo no matter where in the vfo you are when you tell it to start scanning...

Anyone know if this is common in these rigs or what? Is it something to do with the microprocessor?

Thanks,

Andrea

3230. HF Rig Info. Sought

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-28 12:11:00 UTC
From: lwwald@lims01.lerc.nasa.gov
Message-ID: <28SEP199207113537@lims01.lerc.nasa.gov>
Source record: 284803

Greetings, I am interested in getting a good late model used HF rig. I am currently considering the ICOM 751A, the ICOM 735, and the Kenwood 440. I can't afford the new stuff, so I am just looking at used gear.

I'd like peoples' opinions of the rigs, especially folks out there that have had experience with two or three of the rigs. Thank you.

Actually, that seems like about the right percentage for Novices who decide
that Ham Radio is a waste of time and just walk away. Of course, with the
10 year license, you won't know that for quite some time.

Once, long ago in high school, I was a ham-in-training. Then
the guy that was teaching us code and theory had to quit, and
I never had the opportunity to continue.

Now, at the ripe old age of 32, I have gained a neighbor who is
an Expert-class ham, and he has sparked my interest again. He hasn't
the time to tutor me, but I understand that there are home courses
I can take.

Can someone recommend a course to me, or perhaps point me to a FAQ list
that critiques the available courses?

btw nice to see 10m opening up again...

3236. Verticals (question re: GAP)

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-28 14:29:47 UTC
From: tskelton@ncrclm.ClemsonSC.NCR.COM
Message-ID: <1362@ncrclm.ClemsonSC.NCR.COM>
Source record: 284822

Someone asked about the performance of the "GAP" vertical; he was
going to mount it on his roof I believe. There have been other messages
about the Cushcraft vertical versus cost, etc...I will not rehash old
history, but will share a couple of comments and observations of my own.

On our Southeastern DX packetcluster, one user (not to be named) was
sufficiently dissatisfied with the GAP vertical that he sent an e-mail
to ALL registering his disappointment. I don't know how he mounted it,
where he mounted it, etc..but his major complaint was the limited
bandwidth. Enough about the GAP, here are my experiences with verticals.
I have used a Butternut HF6V (80 - 10 meters) on 2 trips to Bermuda
for contests, and left it there for visitors and my host VP9ID to use.
On returning to the states, VP9ID and I made several tests between the
HF6V and his 3 element tribander at 40 ft. (The vertical had between
4 and 8 radials per band) The tribander was ALWAYS 10 dB better than
the vertical, a fact I could belief based on the difficulty of running
USA stations in the IARU and ARRL contests and fighting Europeans to
hold a run frequency. However, the Butternut HF6V vertical has great
bandwidth on 40 - 10 meters (with no adjustment to the coils), and was
pretty good on 80. I could set it for minimum SWR at 3.75 MHZ, and have
no trouble with the rig making contacts at 3.5 (but the SWR was 3:1).
I also compared the vertical at home between my 40, 20 and 15 meter
monobanders and saw, again, at least 10 dB improvement of the monobanders
over the vertical (no surprise). The great design of the Butternut is
in the phsical size of the matching coils on 80 and 40, the use of
high voltage/quality transmitting caps on the 80 and 40 coils, and the
fact that it uses no coils for 20 - 10 meter operation. For an expedition,
mobile work, or limited space, my feeling is forget GAP or Cushcraft:
use the butternut.
During the 1992 ARRL DX SSB contest, using a 100 watt transceiver and a
Butternut HF6V vertical from Bermduda, I was able to make over 1900 QSO's
in the contest. Many stateside stations complemented me on my signal on
80 and 40 meters...clearly due to the design of the antenna. I also had
4 ground radials on 80 and 12 radials on 40.
To the station that was asking about the GAP antenna, please talk to
other vertical users before you spend that much money on something that
may give you unsatisfactory results.
Sorry this droned on so long, but antennas are somewhat of a *religion*
here. 73, Tom WB4IUX

3238. Info on 2m glass/disguise antenna wanted

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-28 14:42:07 UTC
From: petrisko@evax2.engr.arizona.edu
Message-ID: <1992Sep28.074208.3768@arizona.edu>
Source record: 284810

I recently purchased a truck, and for some reason i can't seem to
bring myself to drill holes in it (no other car i've owned has been
so lucky!)..

Anyway, the question remains... how can I mount some useful antennas?
At bare minimum, i'd like to run 2m on a regular basis, an on-glass
antenna is one route (low to no gain), also antenna specialists used to
make a disguise antenna (am/fm/2m) but that has been discontinued.

Does anyone know of any other manufaturer that makes a disguise antenna?
Other suggestions would be appreciated as well...

-bill

This is all probably fine for amateur applications (all we care about
really), but at higher commercial power levels, might not a 1 dB power
drop across a connector represent a safety or reliability hazard?

BNC's are also used in some datacom applications, e.g. IBM 3270 type terminals and controllers use them. The twist-on versions are much easier to install than the solder-on versions with the little gaskets, spacers, etc. In one place I worked where we had literally thousands of these connectors the failure rate dropped dramatically when we went to the twist-on variety, esp once we found a stripper that prepared the cable (RG-62) in one motion. Of course, in these applications the impedance characteristics of the BNC are not as important (within reason) as in UHF and higher applications.

>> Has anyone had a problem with the Periphex brand batteries...I bought a
BP-84S 18 months ago that has failed. The tech at Periphex
told me that there was nothing that I could do to repair this battery
and that I should buy another one. (Glen Shiery WD6FMZ) <<

Glenn

I bought (2) 3S batteries for my Yaesu HT about 2 yrs ago and both of them died
within weeks of each other. I have talked to other hams and have been told
that 2yrs is a pretty good lifetime considering the usage they go through. I
am going to try to salvage the good cells from one and get one pack going
again. It may not last very long but I am thinking about rigging up a battery
pack using camcorder batteries. I bought my camcorder batteries about a year
before the HT batteries and they are still going strong. But then they are
2Ahr vs the 1.2Ahr HT batteries.

Good luck
__mike (N5PWP)

In article <1992Sep28.074208.3768@arizona.edu> petrisko@evax2.engr.arizona.edu writes:
>Anyway, the question remains... how can I mount some useful antennas?

I like my 2m 5/8-wave magmount. To get the coax inside the car, try a technique that I learned from another ham: take a DIP chip tube, and cut it to the appropriate length so that it fits over the top edge of the glass and goes all the way across the window. Then, cut a notch in it that's just wide enough for the coax to go through. When you roll up the window, the coax goes through the notch, and the rest of the tube makes a rather good compression fit against the weatherstripping. No more problems with wind noise, or rain leaking in the car. That door can't be used much, but you might be able to bring it in through the back window in your truck.

3243. Operating Procedures

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-28 16:32:36 UTC
From: tonyp@convex.com
Message-ID: <1992Sep28.163236.15349@convex.com>
Source record: 284815

I'm trying to find a diplomatic way of stating this, so I don't start a flame fest...

To the folks that are teaching the ham radio courses;

ARE OPERATING PROCEDURES BEING TAUGHT NOW-ADAYS?

When I took the novice course in high school the instructor also covered "how to blend in". He didn't want any of his novices to sound like amateurs [pun intended].

Besides learning the code and theory he would have us do simulated QSOs and sometimes would fire up the HS station and have us observe real ones. He'd point out all the finer things and explain them.

By the time we got our tickets we could fit in and even the crotchity old geezers would work us - and when they found out we were just licensed they'd be quite impressed!

(QST ran an article recently of a newly licensed ham getting a 2 meter rig and going on a repeater without the proper procedure. The results were what'd you've come to expect from the repeat gestapo). The poor guy was quite upset over it. Whose fault was it - the "new guy" or the guy who supposedly instructed him?

Some of the quirks I've run into this weekend (all over - including the amateur extra portion) were:

o 3 MINUTES of CQ followed by a callsign and a "KN".
o Feller asked me a question, and just sat back (I guess) - no "BK".
o I answered a CQ. The feller spent the next 10 minutes telling me that he couldn't copy me.
o Feller using a rock-based receiver - didn't tune 1KHZ off his centre frequency (responding station had to QSY to get his attention).
o Everyone just plops down on a frequency and calls CQ - without so much as a QRL?.

Unlike every other aspect of life, we are in control of what goes on on the amateur bands. We dictate how we want it to be - the look and feel.

If we run it indifferently we will lose what has taken years to build.

If we're not careful Amateur Radio licenses will become more and more like driver's licenses. There will be the same kind of chaos and sloppy operating procedures as there are on the roads now.

73,
tonyp

No question about it. I pointed out in my original article that
(according to the ARRL handbook article on 180 meter antennas) a good
starting point was one half wavelength of wire...

3245. Yaesu FT-415 tech tip

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-28 17:18:33 UTC
From: owens@acsu.buffalo.edu
Message-ID: <BvAtEx.3ow@acsu.buffalo.edu>
Source record: 284819

Just a quick note about an experience my father (N2RJB) went through with his brand new Yaesu FT-415. When he ordered it, it was supposed to have Rx 130-174 and Tx 140-150, but it arrived only able to cover 144-148. After much fiddling and looking in the manual, he called the reseller's tech support and found out that his radio should have arrived with the wider range but must have been set up incorrectly at the factory.

The procedure to get the wider frequency range is simply to turn the radio on while holding the up and down arrow keys. This is a rather important bit of information, since the tech also said that resetting the CPU (press and hold MR and VFO while turning the radio on) also sets the frequency range back to 144-148! No idea why Yaesu didn't include it in the manual...

Hello Fellow Hams,

I am WB7PJS. My dad was W6CAZ. He passed away 4 years ago. Shortly after he passed away, I called up the FCC office in San Francisco and asked them if there was a way I could change my call to his. He had his call since, I believe, the 1940's. They told me there is no provision to transfer a call sign and there is no way to do this. I would still like to get his call sign and keep it in my family, instead of it being re-issued to someone else. Does anyone know of any way I can do this?

Thanks in advance for your help,

Roger Myers WB7PJS

3251. Radio Wave Polarization

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-28 18:06:33 UTC
From: miles@emx.cc.utexas.edu
Message-ID: <80640@ut-emx.uucp>
Source record: 284821

What is the polarization of the signal from a 1/2-wave dipole antenna configured in the shape of the letter L? Assume one leg of the L is vertical, the other horizontal, and it is fed with balanced line.

The obvious (?) answer is that the signal is part horizontal and part vertical, or is polarized at a 45 degree angle.

If the obvious answer is correct (and I do not know if it is or not), then what is the signal polarization from a 1/4-wave ground plane or vertical antenna fed with balanced line?

Source record: 284823

****
Plans are being finalized for operation of the 46m (150') radio
telescope at Algonquin Provincial Park (FN05xw) in Ontario.
Members of the Toronto VHF Society visited the site this
past weekend and we found the dish to be fully operational.

We now plan to activate the dish on 432 MHz EME for the second
weekend of the ARRL EME contest. We will be on the air for the
full two-day period. Operation will be on 432.050, listening
+ and - 10 kHz. Note the frequency change from a previous
announcement. All contacts will be using the callsign
VE3ONT.

With >> 40 dBc gain and VE3CRU's 8938 Death-Ray amplifier
mounted at the feedpoint, we should be about 10 dB above the
noise on most Oscar-class antennas. We are anxious to work
as many first-time-EME stations as possible.

Please distribute this notice widely. Watch for further details.

I think they don't make car batteries like they used to.

My trusty old '74 VW Beetle still had the original battery in it in
1982. One morning the car wouldn't start, so I removed the battery
and took it down to Sears to trade in on a new Die Hard.

Unfortunately, the new battery didn't work either. Turned out to be
a bad connection to the starter solenoid.

So the old battery was still going strong after 8 years. And most
of those years were in Connecticut where the winters get COLD. I was
dispappointed I replaced it -- I was curious to see how long it would
last! By the way, I never put anything but distilled or de-ionized
water in it.

From: MROWEN%STLAWU.BITNET@cunyvm.cuny.edu
Message-ID: <9209281941.AA00755@ucsd.edu>
Source record: 284729

Well, this is half of the answer...
The NC in BNC & TNC comes from the last names of their designers. The other half of the answer, which I don't have, is the actual names... Anyway, Mr N and Mr C, whoever they were, designed both connectors. B is for Bayonnet and T is for Threaded. The N connector was designed by Mr N alone; I don't know for sure but I'll bet that Mr C did the Type C connector. It's no miracle, then, that BNCs can be fit to type N connectors (just shove 'em together in a pinch, so to speak).

Like I said, half the answer.

>This is all probably fine for amateur applications (all we care about
>really), but at higher commercial power levels, might not a 1 dB power
>drop across a connector represent a safety or reliability hazard?

.1 dB is about a 2.3% power loss. Since most of this power is reflected,
not absorbed, the power dissipation in the connector is much less.

At amateur power levels (<1500W), .1 dB is about 35 watts. I don't
know how much of this is absorbed and how much reflected, but you
could get a pretty good idea simply by feeling the connector:
if it gets hot, then you have a problem.

It's probably a good idea to go to N connectors if you want to run the
legal limit on the 450 MHz band.

>>
>>a bayonet connector (TNC, N, BNC, C, SMA, you name it)

>Well, I can't name it - does anyone know what all these connector names
>stand for? Or do they stand for anything? I know what most of them look
>like, but why, for instance, is a BNC called a BNC?

The N connector was named by a guy with the last name of Neil. The C
connector by a Mr. Concelman. (Not sure of spelling.)

The collaborated on the BNC connector: Bayonet-mount Neil-Concelman.

The TNC is a Thread-mount Neil-Concelman.

I think the "SM" in "SMA" stands for Sub-Miniature. There is also an
"SMB" and "SMC" connector, so I think the "A" is just to serialize
the series.

UHF means Ultra-High-Frequency. When these connectors were invented
back in the 40's (30's?), anything above about 30 MHz was considered
"Ultra-High".

Tony,

First.... honey bunny????!?!??? (sorry I couldn't resist :-))

I have taught either a Novice or combination Novice/Technician class for several years. I agree with you about operating practices, and spend a fair amount of time trying to explain, teach, give examples and otherwise guide the unguided about operation practices.

I also include many phone operating practices. Of course, I have my pet peaves, so I sometimes concentrate on these...

Many of the CW practices that you mentioned

plus the use of the phrase 'call please' (some use this instead of the word 'break', or other attention getting phrases. To me 'call please' (we're talking about repeater operation mostly, although I have heard it on HF too) means that a station that is NOT currently engaged in the ongoing converstation (QSO for you english impared hams ;-)) wants to make a short call to another station who is also NOT in the current converstation. This implies that if the called station is contacted that they will make BRIEF plans to either stand by for move to another frequency.

Also the term 'my personal here is' instead of saying 'my name is'

And the method of finding a frequency to call another station, CQ or any other use:

1st .... Listen for a clear frequency

2nd ..... Listen again for a clear frequency

3rd .... Listen again for the stations (including weak signals) that you probably missed the first time.

4th ... Ask if the frequency is in use and then go to step 1

5th ... repeat step 4.

ok... now make your call.

This sounds like a long list, but I recently had a student personaly
thank me for this type of instruction.... and he wondered why others
did not offer this type of curtesy on the air. (I know what he means). :-(

I basically stress that people should FIRST: Be curteous!!!, and second
use PLAIN ENGLISH (except on CW where Q-codes are helpful).

Does this answer your question?

Rich

I will keep my Bird and its half dozen slugs thankee kindly. I bought the bird for reliabiliy which it has given me for 20 years. I tune for maximum out and minimum in. If the meter doesn't move on reverse then there probably isn't much there to move. As for the leather case, the meter is the left between the HF rig and the transmatch unless I take it out to tweak some VHF widget or some such.

Why should I or anybody else care what the VSWR is? What is this VSWR stuff anyway? What I would kind of like to do is put a couple of RF ammeters in the two leads of my #14 open wire feeders. Might as well see what goes up to the roof.

Please, no kindly letters explaining what VSWR is, I knew that stuff before most of you reached puberty.

> -joe,
> in the dark

Per previous discussions:

TNC - Threaded Niell-Concelman (connectors)
BNC - Bayonet Niell-Concelman "
N - Niell "
C - Concelman "
HN - High Voltage Niell
UHF - Ultra High Frequency (when 30MHz was UHF).
SMA - Sub Miniature type A
SMB - Sub Miniature type B
SMC - Sub Miniature type C
SMS - Sub Miniature Slide-on
SSMA - SubSub Miniature type A
MHV - Medium High Voltage (variation on BNC)
SHV - Standard High Voltage (variation on BNC)

Niell and Concelman were design engineers at Bell Labs
The rest are "intuitively obvious".

You are darn right.

Even in industry I have seen connectors where the insulating spacer melted if
the installer got over emotional with the soldering iron. When I put in my
Larsen antenna in the car it came with a nice Amphenol PL259 which soldered
like a dream using a 60 W Weller iron on the trunk on a nice crisp fall day.

The last Radio Shack connector I bought (they are the only supplier in town)
twisted apart in my hands while I was screwing in its spouce.

>generation of the alert tone. Anyone in the broadcast business is
>probably aware of this requirement.The application would be to use
>a garden variety AM or FM broadcast receiver and an add on decoder.
>Thanks.

The tone is specified in the FCC rules (47 CFR 73.906) as 853 Hz + 960
Hz for 20-25 sec. The signal must be transmitted at 40% of the maximum
system level. This signal can be used for decoders at broadcast
stations so that secondary broadcast stations can decode the EBS
messages of higher power primary broadcasters.

> Amphenol data book.

The TNC connectors are preferred over the BNC primarily for RF shielding. The BNC connnector although providing a smooth continuous impedance would allow RF to leak out of the connector, something the TNC does not. Obviously in an application like a cellular antenna mount the real advantage is simply that it is mechanically more stable.

By the way, the UHF connector was designed specifically to physical not RF or impedance considerations. And it was for RG-8 coax in particular. Because of the "new standard" connector, subsequent coax was designed around the outside jacket diameter of RG-8. Ah, once again our military genius at work. But then again, back then 30 MHz was UHF :-)

I have a Swan 700CX that I bought for $300. It's been worth every penny as it puts out 400 watts on SSB on 20,40 and 80 with no trouble at all. It's a old tube rig that does a good job of heating up my shack. 8-) It's VFO is rock steady after a 10 minute warm up period though I have heard of other models of Swans having drift problems. It covers 10,15,20,40 and 80 meters. Make sure you get one with a VOX unit on it other wise you will have to manually switch between receive and transmit on CW. Probably could build a VOX without much problem. There is a 700CW version out with extra switchable filters built in. I am buying my friend's Swan 500 to put in my car. Just hope it doesn't cause it to list to one side HI!

73!

Jeff

>If the obvious answer is correct (and I do not know if it is or not),
>then what is the signal polarization from a 1/4-wave ground plane or
>vertical antenna fed with balanced line?

>de Miles Abernathy, N5KOB
>miles@emx.cc.utexas.edu

In considering this kind of problem it's helpful to see what the antenna looks like from various positions. For example, if you look at a dipole from the side, you see a horizontal wire. The polarization from the antenna is horizontal. But now look at the dipole from the end, above its level:

you

---------- ---------
dipole

Now what you see is a vertical line. (That is, facing the antenna, the apparent width is just the wire diameter, while the height is greater.) The polarization from the dipole is VERTICAL off the ends. (This doesn't seem to be widely known.) The other thing you have to consider is the nature of the currents on the antenna. For example, look at an inverted vee from the side:

.
. .
. .
. .

If the current in the left leg is going up, an equal current at the corresponding point in the right leg is going down. A vector diagram adding the currents (a vector up and to the right added to an equal vector down and to the right) results in a purely horizontal result. The polarization from this antenna is horizontal from the side. (From the end it's vertical. Although the vectors are equal and opposite, the fields arrive at the viewer at different times, so aren't completely out of phase.)

Ok, now let's look at your L. It's just a rotated version of the inverted vee. From the side, the polarization is midway between vertical and horizontal. (I'm assuming free space for simplicity. The presence of ground

adds a reflected field from each leg as well as altering the relative currents in the legs, making the situation more complex. The principle is still the same, though.) In the plane of the L, the polarization is purely vertical. At other angles from the antenna, it's in between.

In a ground plane antenna, the fields from opposite pairs of radials cancel directly broadside to the radials because the currents flowing in them are equal and in opposite physical directions. However, for the same reason the inverted vee radiates in the plane containing it, the radials do generate a field in directions other than broadside. (It's much weaker than a dipole field, though.) Like a dipole, the polarization of the field from a pair of radials is horizontal when broadside to the pair, vertical in the plane of the pair, and between at other angles. The field from the radials is much weaker than the field from the vertical section, however, resulting in a nearly vertically polarized total field in all directions. If the radials are bent downward, they generate a vertically polarized field broadside to each pair. (This works just like the inverted vee except that the relative phase of the currents is reversed, resulting in the horizontal, rather than vertical, component cancelling.) A vertical dipole, of course, radiates a vertically polarized field in all directions.

This is difficult to explain without pictures, but hope this answers your questions.

73,
Roy Lewallen
W7EL

Oh.....I know *just* what you're talkin' about.....I've seen this one
person a while back...(about 2 or 3 months ago...)....He'd just bought the
most Expensive 2 meter HT on the market, took it out of the package, charged
the battery, and got on the local repeater.....I guess.....I don't think he
was probably ever taught proper repeater operating procedure...He had this
"Autopatch Syndrome" where he wanted to call anyone and everyone from the
autopatch.....I mean....Long distance even....(charged to his calling card of
course...;-) I think this is repeater abuse, but that's just my opinion...If
you need to call someone long-distance on a repeater, that's cool if you're
broken down/stranded somewhere, but getting on the repeater and just playing
with the tones all day is Not the proper way to figure out how...I agree with
ya 100%.....These fellas (and gals ;-) should oughta be taught proper ops
before just barging on the repeater unprepared and all.....at least listen for
a while, y'know?
They should also be taught that "kerchunking" (without an I.D.
following it...) is illegal as it is an unidentified transmission.....One day,
I'm gonna go T-Hunt the individual around here that keeps doin' it on our
machine.....<grin>
Please, No Flames.....These are my opinions only and I do not expect
anyone else to agree with them.......I already agree with everyone else and
their opinions before they say anything! :-)

Howdy!

The Subject says it all...;-)
I am in need of a Very used Kenwood 130 HF rig or equivalent for a
very reasonable price.....It must be ALL solid state...All mode
(preferably...) Decent filters...And cover 160-10 meters...(Warc Bands are
not necessary, but would be ok...) Anything about the same era as the
Kenwood 130 Or newer would be ok...
Also...I do not want junk...It must be in Very good operating
condition.....
Will Pay cash upon inspection and approval.

Tnx es 73!

Re "the personal here is" for "my name is", and other barbarisms...

Radio is a lot like scholarly writing in one important respect: lots of people think they aren't supposed/allowed to speak plain English when doing it.

The world is full of people who, in front of a microphone, won't call a name a name. The world is also full of young scientists who, writing their first journal article, think they have to use the most stilted, overinflated prose they can manage -- where every "method" is a "methodology" and instead of "X kicked Y" we get "an incident of pedal contact initiated by X and affecting Y" and you get the idea...

I think the sociolinguistic principle is the same. People don't _notice_ plain English when they hear it on the air or see it in a journal. Instead, they imitate things they _notice_, i.e., oddities, in a frantic attempt to belong.

73 de N4TMI (PhD linguistics, they pay me to think about things like this!).

3286. Problems in tuning the Larsen KG-2/70 on glass antenna?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-29 03:18:39 UTC
From: jdw@wucs1.wustl.edu
Message-ID: <1992Sep29.031839.1340@wuecl.wustl.edu>
Source record: 284764

I have purchased a Larsen KG-2/70 on glass antenna with my
Kenwood TM-732A (Dual Band rig). I was wanting to find out if anyone else
has used the Larsen antenna, and if they experienced any tuning or intallation
problems, particularly over defroster wires, per the directions.

I ran a set of VSWR tests on both bands. They advertise 1.5:1 across both
bands. The VHF was centered at 1.5:1 on 145.500 MHz, going up or down from here
only made matters worse. The UHF was much better, but still not within the
1.5:1 rating. At 442.000 MHz the VSWR was 1.6:1 and at 448.000 it was
a very respecible 1.1:1. This was tollerable, but per Larsen, I was NOT
to cut the antenna! Cutting the antenna, top or bottom could possibly
make matters worse.

The technician I spoke with at Larsen was very helpfull, and basically
this is one that is not tuned correctly, so they are exchanging it.

I have the antenna installed on a Mazda Rx-7 on the back hatch. To make matters
worse, the glass is not very flat, and I have the Mazda (ABS platic) louvers
on the car. I eliminated the louver as being the cause (removed it), and ran
a male to male UHF connector to the back of the SWR meter (Diamond). The
couplers were also mounted per the directions, centered over one of the
defroster elements.

I am trying to find out if anyone else has had the same experience
good or bad I'd like to hear about it. This is just about the only antenna
that I could put on this car. Also note: Per Larsen the coax on this antenna
must be an odd number of 1/4 wave-lengths (2m). So DO NOT cut the coax to
length (at least without measuring it!)... And NO I did not make this mistake!

Postings and direct email welcome.

Thanks!

Unfortunately, twist-on and crimp-on BNC connectors are not as
mechanically strong as the solder-on type. Yes, solder-on connectors
require more time and care when attaching to the cable. But I think
it's worth it when you wind up with a connector so strongly attached
that the cable breaks before cable<->connector junction does.

SILVER SPRING, MD SEPTEMBER 26, 1992 BID: $ANS-270.02
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule

AMSAT Operations Nets are planned for the following times. Mode B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz and the Mode J/L Nets on a downlink of 435.970 MHz.

Date UTC Mode Phs NCS Alt

3-Oct-92 1830 B 162 N7NQM W5IU
10-Oct-92 2120 J 145 WB6LLO WA5ZIB
17-Oct-92 1430 B 163 WA5ZIB WJ9F

Any stations with information on current events would be most welcome. In the unlikely event that either the Net Control Station or the alternate do

not call on frequency, any participant is invited to act as the NCS.

Slow Scan Television on AO-13

SSTV sessions will be held on UTC Saturdays and Sundays. Mode J on a downlink of 435.980 MHz, and Mode B immediately after Mode J on 145.960 MHz. OPS NETS will take priority so look for SSTV activity immediately after they conclude.

3290. locating TV antenna near ham antennas

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-29 06:04:50 UTC
From: dale@sequent.com
Message-ID: <1992Sep29.060450.7022@sequent.com>
Source record: 284771

I would like information on best placement and feed line for a TV antenna (VHF/UHF) which will be placed at house next to my ham antennas. I have completed work on a 55 ft tower, a tribander goes up next weekend. I also have a dipole for 80 meters fed with 450 ohm ladder line. I can run up to 500 watts.

The person next door has their TV located at the end of the house nearest my tower -- perhaps 45 feet. I am presently using a Cushcraft R7 vertical at the far end of the yard from my neighbor, but as I said, the tri-bander (Cushcraft A3S with 40 meter dipole added) goes on the air next week, weather permitting.

The person next door is evidently using "rabbit ears" for the TV, but while watching my tower go up mentioned one day that she would like an outside TV antenna. I offered to install it for her (after I assured here that our housing development really did allow outside antennas. :-)

Unfortunately her antenna must point through my antennas toward the local TV stations. My guess is that the best thing is to place her antenna at the far end of her house to keep it as far away as possible from my antennas, even though the feed line becomes much longer. Is this true?

Next question is whether I run coax from the antenna or use 300 ohm twinlead. I feel that the coax will be more resistant to the RF from my transmitting, but will have higher loss than the twinlead, especially for the UHF. I don't have any experience with TV twinlead -- will that pick up TVI? What is best for this situation?

Final question -- should I just install a high pass filter from the start, or wait and see if there are any problems? The reason for installing from the start is so if it causes some drop in signal that isn't noticed later. I haven't experimented with any of these so I don't know how much attenuation they provide to the signal they should be passing.

I don't think they are experiencing many problems now, but I suspect that I'll be be getting on the air more once I finish up this antenna work. I believe that 80 meters is causing most of the TVI that I do generate, possibly due to high SWR.

Thanks for any suggestions. 73, Dale. N7PEX

3291. AURORA WATCH: Low Latitude Auroral Activity Watch

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-29 07:18:00 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.717751080@honte>
Source record: 284775
Cross-posted to: sci.astro,sci.geo.meteorology,rec.radio.amateur.misc,rec.radio.shortwave

/\

LOW LATITUDE AURORAL ACTIVITY WATCH

ISSUED: 06:15 UT, 29 SEPTEMBER

/\

MODERATE RISK PERIOD: 29 Sep - 30 Sep (UT days)

POTENTIAL MAGNITUDE OF LOW LATITUDE AURORAL ACTIVITY: LOW - MODERATE

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: >43 North Latitude

POTENTIAL LUNAR INTERFERENCE: LOW

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM LOW LATITUDES: FAIR

AURORAL ACTIVITY MAY BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

OREGON TO SOUTHERN IDAHO AND PARTS OF NORTHERN UTAH TO WYOMING TO
NEBRASKA TO NORTHERN MISSOURI TO ILLINOIS TO INDIANA AND POSSIBLY
PARTS OF KENTUCKY TO WEST VIRGINIA TO DELAWARE.

SYNOPSIS...

An intense burst of auroral activity has occurred over the last three
hours. The source of this disturbance is uncertain, but is likely
related to a well placed solar coronal hole. The equatorward edge of
the auroral oval was observed at the zenith near geographic 115W48N at
06:00 UTC. Moderate levels of auroral activity may be observed over the
lower latitude regions if this disturbance continues. Lunar phase will
not inhibit attempts to view activity. Conditions are therefore optimum.

This watch will remain active until 19:00 UT on 30 September when it
will either be updated or allowed to expire.

** End of Watch **

3295. Re: The Truth about UHF Connectors

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-29 08:44:40 UTC
From: jgd@dixie.com
Message-ID: <3b+p2kq@dixie.com>
Source record: 284777

alanb@hpnmdla.sr.hp.com (Alan Bloom) writes:

>At amateur power levels (<1500W), .1 dB is about 35 watts. I don't
>know how much of this is absorbed and how much reflected, but you
>could get a pretty good idea simply by feeling the connector:
>if it gets hot, then you have a problem.

True.

A few years ago I conducted an interesting experiment. I had in my lab
an infrared imaging video camera for repair. This $20,000 instrument
had the fancy solid germanium lens and everything and could resolve
about 0.05 deg F. I kept it awhile after fixing it to experiment.

One experiment I did was to videotape my ham station (2 mtr rig, packet,
200 watt amp) while continuously keyed. It was fascinating. Keying
the rig made the area right under the power transistors light up
brilliantly almost instantly. The brilliance flowed out across the
heatsink like thick syrup. Of even more interest was the feedline.
Previously invisible against the background, the snake's nest of feedline
lit up like neon tubes. RG-8 was used for all connections. The output
of the amp was jumpered a short distance over to the hardline going up
the tower. There was a teflon-dielectric UHF connector splice, complete
with barrel, in the high power line. The interesting thing was, this
splice was the only part that remained totally cool. Even accounting for
the additional heat capacity of the metal, there was obviously no power
being dissipated.

If any power was being reflected, the upstream feedline would be expected to
be slightly warmer because of the multiple transversals. This was indeed
apparent when an intentional mismatch was created using the vicegrip method.
("Aye Bubba, look at all them electrons backing up behind them vicegrips!)
None was noted in the "un-gripped" apparatus.

As to N connectors being more waterproof than UHF, maybe but only when
properly assembled. I've yet to see a ham who is not also a trained
technician properly assemble a traditional N. Crimp Ns are easy but
then so are crimp UHFs. Most hams CAN adequately assemble UHF connectors.
ANY connector - even wires wrapped together - is waterproof when properly
coated with self-vulcanizing silicone tape, putty, Raychem heatshrink or
similar materials. In other words, waterproofing is a non-issue.

The ONLY reason I can see for not using good Teflon dilectric UHF below 500
mhz is theological in nature.

John

No. Absent the shell, the two connectors are identical. Try it sometime.
Point of fact. All the cellular antennas in my cars are equipped with
BNC connectors with the bayonet removed. In its place is a piece of
surgical rubber tube. These connectors easily push on and off of my
Panasonic portable phone.

Fact is the outer shield continuity is maintained by the serrated ring
inside the shell. The bayonet or threaded shell serves simply to
mechanically fasten the thing in place.

World Organization of the Scout Movement - World Scout Bureau

Circular No. 17/1992 Geneva, July 1992

To: International Commissioners
National JOTA Organizers (NJO's)

35th Jamboree-On-The-Air, 17-18 October 1992

Dear colleagues,

This is a final reminder that the 35th JOTA will be held over the weekend of 17 and 18 October 1992.

JOTA is a world-wide event. Units may operate for 48 hours, from Saturday 00.00 h until Sunday 24.00 h local time. Due to the world's time differences, this period is not the same for everyone. To determine the times at which you can most likely contact a certain part of the world, calculate a time difference and ask your amateur radio operator about the radio propagation prediction (a sort of weather forecast for radio waves).

Members of the World Association of Girl Guides and Girl Scouts (WAGGGS) are kindly invited to take part in the JOTA and enjoy this international event together with the Scouts.

Any authorized frequency may be used to establish a contact. National radio regulations must be strictly observed. To find each other easily, listen on the agreed World Scout Frequencies.

World Scout Frequencies
Band SSB(phone) CW(morse)
80m 3.740 & 3.940 MHz 3.590 MHz
40m 7.090 MHz 7.030 MHz
20m 14.290 MHz 14.070 MHz
17m 18.140 MHz 18.080 MHz
15m 21.360 MHz 21.140 MHz
12m 24.960 MHz 24.910 MHz
10m 28.990 MHz 28.190 MHz

World Federation of Great Towers

The World Federation of Great Towers (WFGT) is an organization in which large towers all over the world co-operate for special activities. It was founded in 1989 with the aim to stimulate communication and exchanges of all sort between the people of the world.

The WFGT invites Scouts to take part in the JOTA from the top of their Towers. Amateur radio stations will be installed on the towers and professional communication facilities to contact the other towers will be made available also.

The following towers will take part: Centrepoint Tower in Sydney (Australia), Donauturm in Vienna (Austria), CN Tower in Toronto (Canada), Empire State Building in New York (USA), Tour Eiffel in Paris (France), Euromast in Rotterdam (Netherlands), Ostankino Tower in Moscow (Russia), Blackpool Tower in Blackpool (United Kingdom) and British Telecom Tower in London (United Kingdom). Plans are being made to issue a JOTA poster with all the participating towers on it. More information will follow if this can be realized.

Some of these stations may use special call signs as well. It is planned to establish a television link between New York, Paris and Moscow at some time during the weekend. This will make it possible for the scouts at those towers to have a forum discussion. Further details are not yet known, but can be obtained from the World Bureau's radio station HB9S during the JOTA.

National JOTA Reports

JOTA organizers are requested to send a report to the World Scout Bureau soon after the event. Enclosed with this circular is the report form for the 35th JOTA. This form is intended for the National JOTA Organizer (NJO) but it may be used by individual units if a country has no NJO.

What is a good report? A National JOTA Report gives an impression of what the JOTA was like in your country. It contains ideas and comments, suggestions for future programmes and describes the most important and interesting contacts that were made. A summary of it will be published in the World JOTA Report, so others may benefit from it. The figures that are requested in the report form will be used to compile some statistics. A reasonable estimate would be appreciated if they cannot be specified accurately.

Please take a few moments to fill out this form and feel free to include any other information on separate papers.

Send your report to the World Scout Bureau before the 31st of December 1992!!

The JOTA letter game

The Jamboree On The Air is an activity based on communication between Scouts and Guides. And what better way than a game to learn how to communicate with foreign stations? Last year we introduced the JOTA letter game. The enthusiastic reactions also indicated that it was extremely difficult. So we made it easier this year. To participate is extremely simple:

The aim of the game is to collect 5 different letters which together form the last name of a person who is famous in the radio world. Next you have to find his first name. The solution to the letter game is the full name of this person.

We distributed five 5 letters to different countries, all over the world, in such a way that each region has the complete word. You do not have to make long distance contacts to find all the letters; the word has been distributed several times. All participating Great Towers (see above) and the JOTA stations in their country as well as in some other counties have a letter. All JOTA stations in these countries will tell you what this letter is when you contact them. You will have to do the following:

o ask the Scouts and Guides whom you contact if they can give you a letter of the letter game.

o if they do, write down this letter.

o when you collected all five letter, make a name of it.

o find the first name of the person

o report the solution to your National JOTA Organizer.

Of course, we do not tell you beforehand which country has received a letter from us; you will have to find out yourselves.

We wish you many happy hours with this letter game.

HB9S on 35th JOTA camp

During the JOTA weekend, there will be a JOTA camp at the Scout centre Les Perouses in Satigny, just outside Geneva. Scouts from several countries will be able to take part in various radio-scouting workshops on the occasion of the 35th JOTA. The Bureau's radio station HB9S will operate from there.

An official transmission with news from the camp is planned on Saturday 17 October, at 15.00 GMT on 14.270 MHz.

HB9S will operate most of Saturday and Sunday, with short breaks during the night. Transmitters will be on the air simultaneously on the 10/15/20 metre, 160/80/40 metre, and 0.7/2 metre bands. The station manager Yves Margot, HB9AOF, will be assisted by Richard Middelkoop, PA3BAR, some World Bureau staff members and an international team of scout radio amateurs.

Making a contact with HB9S often takes some patience. Usually many stations are calling at the same time. Please follow the instructions given by the operators and do not interfere with on-going contacts. The operators will do the best they can to make contact with Scout stations world-wide and speak to Scouts in as many languages as possible.

National Report Competition

Again this year, we would like to organize a small competition for National JOTA Organizers. A jury will judge the National JOTA Reports that you send us and award this prize to the best one a copy of the book "Scouting Round the World", issued in 1990 by the World Scout Bureau, which contains facts and information about all Scout Associations worldwide.

To take part in this competition, a National JOTA Organizer simply needs to note the following:

Each national JOTA report needs:

a) to be received on time in Geneva or Zoetermeer, i.e., by 31 December 1992.

b) to include the fully completed JOTA report form.

The winning report will be announced in the World JOTA Report that is issued in March 1993.

Special call signs in Austria

To commemorate the 35th JOTA, all amateur radio stations in Austria (so not only the Scout stations) will replace the figure in their call signs by the figure 35 during the whole month of October '92. The station on the Donauturm in Vienna will have the call sign OE35XVS.

News from the 3rd European Radio Scouting Seminar

In May this year some 40 National JOTA Organizers and their team members met in Veijle, Denmark for a four day seminar. In total 19 different countries were represented, including Romania, Czeckoslovakia and Ukraine. Some NJO's came as far away as Tanzania and Australia. "International understanding through communication" was the theme of the meeting. Discussions focussed on improving the contents of the (radio) contacts between Scouts and on practical organization matters for the JOTA. The participation of the Central and Eastern European countries in the JOTA received extra attention. A full report if the meeting will be available soon.

35 years of JOTA history

>From the inception of the JOTA idea at the World Jamboree in Sutton Coldfield in 1957 to the present 35th edition of this world-wide event, all is described in detail in the JOTA history report "The JOTA Story". It is written by L. F. Jarrett, the former World JOTA Organizer for 28 years. The report tells you about the organization of the event, shows how the participation increased over the years, reprints all the JOTA logo's that were ever used and quotes from all the World JOTA Reports. If you want to give your Scouts some background on the event, this is the report you will need. "The JOTA Story" is being published especially on the occasion of the 35th JOTA as a limited edition. Order

your copy now, directly from the World Scout Bureau in Geneva.

Let's talk
----
the JOTA is an excellent opportunity to meet Scouts, Guides and others from many countries. Exchange ideas, learn about other cultures and habits and make new friends. This year's JOTA theme "Let's talk" provides an opportunity for an interesting weekend programme. I hope that this Jamboree On The Air will once again give its participants the experience of the International Brotherhood of World Scouting and will contribute to mutua;l understanding and respect. I wish you all an enjoyable weekend.

Sincerely,

Jacques Moreillon
Secretary General

In our area, Radio Shacks are no longer carrying the "Novice Class License"
book and tapes. Instead they carry "Now We're Talking"....the ARRL book
for Technician license. Makes sense, since they sell a 2 meter radio.
And it's an excellent book!

The info on coax connector names and history has prompted me
to ask about the history of the D-subminiature connector. I
had assumed these were born in the 60s until I noticed a picture
of one in a Cannon ad in the back of the 1957 ARRL Handbook
(love those ads). What company invented them, and when?

|>
|>AL N1AL

Waterproof, no. (To me, "waterproof" means you can take it scuba-diving without problem.) I believe Amphenol calls them "weatherproof" which seems to mean they can be left out in rain/fog/snow without further protection.

Yes, that assumes proper installation. It also assumes using the proper variant; not all variants are rated "weatherproof".

Incidentally, (most) BNC connectors are also rated "weatherproof". Not surprising if you look at them carefully; you'll see a rubber gasket around the coax, and another rubber gasket inside the outer shell where it will seal against the top rim of the jack.

3304. lightning protection of roof towers

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-29 15:30:14 UTC
From: doughty@PCS.CNU.EDU
Message-ID: <9209291528.AA03542@PCS.CNU.EDU>
Source record: 284686

Now that the Tesla coil discussion has died down, this group needs another high voltage topic of discussion, so I offer the following.

I have recently come into posession of a roof mounted tower (about 10 ft. - has thrust bearing, uses guy wires attached to roof, etc.) and want to mount it on the roof of my two story house. My problem is that the tower will be one of the highest structures around, and is almost certain to be struck by lightning sooner or later (at least I want to be prepared). I would like to know the best way to ground the tower.

In the ARRL handbook (and also the NEC - National Electrical Code) there is a lot of discussion about protecting the feedline by grounding the shield of the coax, using arrestors, switching them to ground when not in use etc. There is also some discussion of grounding a REAL tower. But I haven't been able to find much on roof towers. What I want to be sure (or at least as sure as possible) of is that if the antenna/tower gets hit, the lightning strike doesn`t arc through the house, etc.

Some specific questions I have are:

1. What size of ground lead(s) to use for the tower? I realize that bigger is better but the cost of enormous cable is prohibitive. What is reasonable if you EXPECT or PLAN on a direct hit?

2. How many?

3. What paths do I run them? The obvious answer would be the shortest, except that the shortest path is on the opposite side of the house from the shack and the feedlines. Would the resulting 'cage' effect be good or bad?

3. Do I need to stand them off from the roof?

4. Do I need to attach to each leg of the tower?

5. What about the guy wires?

6. Anything else I should know?

I know that there's no guarantee when it comes to lightning strikes, but it is my family in the house and I want to be sure I have done everything I can to protect them.

Thanks for any suggestions. 73, Dave. N4MYA

> vfo you are when you tell it to start scanning...
>
> Anyone know if this is common in these rigs or what? Is it something
> to do with the microprocessor?
This is a feature of the rig. If you are in a VFO when you push the scan button then the rig does a "programmed" scan between the frequencies in memories 11 and 12. So the reason your scan starts at 14.0Mhz is that your memory 11 has 14.0Mhz stored in it.

In a earlier posting Marc Unangst states:
>Unfortunately, twist-on and crimp-on BNC connectors are not as
>mechanically strong as the solder-on type. Yes, solder-on connectors
>require more time and care when attaching to the cable. But I think
>it's worth it when you wind up with a connector so strongly attached
>that the cable breaks before cable<->connector junction does.

I have, for several years, been using the Trompeter BNC connector for
all of my installation. This thing is best described as a "Wrench-On"
connector. No soldering, and in my "hang tests (270 pounds of N7CEU
dangling from the cable) it is always the cable that fails. No soldering,
and stronger than the hubs of hell (The hubs operate at high temperature,
and under a heavy load, hence their great strength).

On another note, having followed this thread from the beginning, is it not
interesting to note that a connector that was initially maligned as a
"3db attenuator" is now suffering abuse only because it isn't WATERPROOF?
Good Grief :)
73

martin@datacomm.ucc.okstate.edu (Martin McCormick) writes:
>I understand that sudden failure of a battery can be caused by sulphides
>building up in the bottom of a cell. When the goop reaches the plates,
>the battery is its own dumby load.

About 3 years or so ago I was perusing my J.C. Whitney catalog and
found this stuff called XV-6. It was supposed to stop the
sulphation process and make the battery bounce back better from
being drained dead. The '87 Jeep Cherokee I had still had the orginal
battery and I figured, what the heck.

Well, I can say the stuff (one of the ingredients is cadnium) didn't
do any harm, the battery continued to function fine. Last month I
went camping and drained the battery dead by leaving the interior lights
and a map light on all night. I got the car jump started and let it
idle for 1/2 hour. At that time I did the nerve racking turn the engine
off and (gulp) try to start it again...which it did.

Since that trip I have become concernend that the battery is dieing
another kind of slow dead (3 to 6 amp charging for an hour and no
change in the specific gravity). But, I figure for the OEM battery
it was doing pretty good (5 and 3/4 years).

Source record: 284698

Hi,

I have owned the older Gap VI for about a year now, and my friend has owned one for a number of years. I was at a hamfest looking for a Beam and came across the Gap booth. Spent a bunch of time there and ran into a lot of very happy owners.

When I first started using the Gap-checked it out and the SWR on all bands met or exceeded the published figures. I have some different types of wire antennas up. In the first few months of testing I noticed on a number of ocassions that my Zepp outperformed the Gap by about 2 S units. I got to upset, I even wrote Gap a letter. I have my Gap mounted in the front yard between, but not real close to some trees (which means it could be doing a lot better).

Well they did answer right back. About this time in my story my 8 year old started to get licensed. I have a Kenwood 820S and between the rig needing tuning and the wire antennas needing to be tuned..no way he was going to do it all. Everytime he played with one of the newer rigs, he loved it (just like a computer, or Nintendo). So I worked a couple of extra jobs and finally found a used Yaesu 757GX at a ham fest.

Between the Gap and the Yaesu, he can just turn on the rig and start working. This ended up in my using the Yaesu and the Gap a lot. I have worked contests, 1000s of QSOs, RTTY and AMTOR.

Depends on the conditions. On 20 meters sometimes it will perform as good as a beam, sometimes even better. Found out the antenna works great on 12 and 30 and 17 meter cw.. on 17 meter SSB I think there is a mod I can do. The newer models of the Gap will do the WARC bands. I don't use 80 meters much, so I would probably get the 40-10 version of the antenna if I redid it.

Summary: it works great, you don't have to use a tuner, by far the BEST ANTENNA FOR THE MONEY. I am looking into Quads right now.. but the GAP will stay. The Gap is much quieter than other verticals and much less expensive.

If I'm not mistaken, you set the upper and lower frequencies for the
scan in memories 11 and 12 (or is it 10 and 11?) and go scan - the
scan will scan those frequencies inclusive (and they have to be in the
same band, I think).

/\

MAJOR GEOMAGNETIC STORM ALERT

ISSUED: 16:30 UT, 29 SEPTEMBER

/\

ATTENTION:

Geomagnetic activity surpassed the major storm threshold at 15:00 UT on
29 September. Major to severe storming has been observed since approximately
03:00 UT. Storm activity is expected to continue for the next 24 hours.

Significant degradation of HF radio signals over the polar to middle
latitude signal paths has been observed. Signal quality is expected to
continue very poor over these paths for the next 48 to 72 hours.

Strong auroral storming has been observed in conjunction with this
disturbance. Activity has been observed throughout the northern to central
U.S. states. Observations of activity will be possible over southern
Australia and New Zealand, as well as the northern to north-central areas of
Europe.

The government is just another business in the eyes of the FCC. But another poster was correct. This ham was Austrailian so our rules don't apply to him (they may, however, apply to the operator in the shuttle).

ADMINISTRATIVE BULLETIN

29 September, 1992

New Service Implemented for Internet Users

/\

NEW AURORAL ACTIVITY SERVICE IMPLEMENTED FOR INTERNET USERS

A new service has been implemented that can be easily accessed by those with Internet FINGER capabilities.

The most recent auroral activity sightings as well as the status of any auroral activity warnings or watches can now be obtained by typing: FINGER AURORA@XI.ULETH.CA or FINGER AURORA@142.66.3.29. After the fingered connection to xi.uleth.ca has been established, there will be a brief pause (up to approximately 30 seconds), followed by the most recent list of sightings.

The information available through this service is updated once each hour. Fresh material is typically available by 30 to 35 minutes past each hour. Sighting reports are presently restricted to North America and are only updated between 22:30 UTC and 17:30 UTC daily (approximately corresponding to local daylight hours for North America).

Any questions or comments regarding this new service should be directed to: Oler@Rho.Uleth.CA, or: COler@Solar.Stanford.Edu.

Message-ID: <574@arrl.org>
Source record: 284710

In rec.radio.amateur.misc, dale@sequent.com (Dale Mosby) writes:

>Unfortunately her antenna must point through my antennas toward
>the local TV stations. My guess is that the best thing is to place
>her antenna at the far end of her house to keep it as far away as
>possible from my antennas, even though the feed line becomes much
>longer. Is this true?

For the most part, this is true. What ultimately counts is signal to noise ratio. Your amateur signal represents the noise. That will fall off as the square of the distance (approximately -- it is not 100% true in the near field). The signal will fall off linearly with the length of the feed line.

>Next question is whether I run coax from the antenna or use 300 ohm
>twinlead. I feel that the coax will be more resistant to the RF
>from my transmitting, but will have higher loss than the twinlead,
>especially for the UHF. I don't have any experience with TV
>twinlead -- will that pick up TVI? What is best for this situation?

Both coax and twin-lead can pick up interference, although coax may be more resistant. I can't really address the loss issue without knowing the length of the line.

>Final question -- should I just install a high pass filter from the
>start, or wait and see if there are any problems? The reason for
>installing from the start is so if it causes some drop in signal
>that isn't noticed later. I haven't experimented with any of these
>so I don't know how much attenuation they provide to the signal they
>should be passing.

I would probably start with the high-pass installed, and have an FT-140-43 or FT-240-43 ferrite core (or two) handy to use as a common-mode choke. A description how to use a common-mode choke, plus lots of sources for high-pass filters, common-mode chokes, ferrites, etc, plus a lot of good tips about EMI control are free for the asking from ARRL HQ. Send me your postal address (there is non-electronic material) and ask for the "RFI Package." If anyone else wants it, I would appreciate it if you would also give me a description of your EMI problem.

>I believe that 80 meters is causing most of the TVI that I
>do generate, possibly due to high SWR.

Acutally, a high SWR in and of itself WILL NOT cause a TVI problem. This is a common myth that has sent many a ham down the wrong trail. The problem with 80-meter TVI is usually a suspectible VCR or the fact that the TV feedline length is often resonant on 80-meters. (Or any of a number of

other factors.)

In summary, if you have TVI, ask for the RFI Package. Also, contact your ARRL Section Technical Coordinator for help. Page 8 of QST lists the Section Managers -- usually including phone numbers. The SM can quickly put you in contact with the Technical Coordinator.

3317. Floor-to-Ceiling Dipole (73 project) ??s

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-29 18:09:10 UTC
From: billg@hpspdla.spd.HP.COM
Message-ID: <32920100@hpspdla.spd.HP.COM>
Source record: 284715

I am about to start building an indoor antenna project that was describe a few months back in 73 magazine (I believe it was the July issue). This antenna is a ceiling-to-floor mounted vertical dipole with an air-wound loading col at one end and capacity hats at both ends.

The article isn't very descriptive, but I have been able to figure just about everything out from the pictures, etc. The one thing that doesn't make sense is this:

Apparently, the capacity hats are isolated from the rest of the dipole via PVC pipe couplers, however, in the photo, it looks like a small jumper wire connects the hat (on the end of the dipole opposite from the coil) to the element. (If you have the magazine, look at the bottom of the antenna to see the jumper I'm talking about). So my question is, if you expend the effort to isolate the hat from the rest of the element via a pipe coupler, why connect it back together again with a jumper? Are capacity hats supposed to be isolated from the element (I don't have a copy of "the Handbook"). By the way, the antenna is supposed to work 10 through 20 meters by moving a tap on the coil.

I'd prefer responses to this post be sent via e-mail since I have not been able to keep up with the net lately.

Thanks,

- Bill G

>vertical, the other horizontal, and it is fed with balanced line.

Assuming you are looking at the antenna perpendicular to the plane
formed by the two wires, the polarization would be at a 45 degree angle.

>what is the signal polarization from a 1/4-wave ground plane or
>vertical antenna fed with balanced line?

Assuming you have some kind of current balun or common-mode choke at
the feedpoint so that there is no feedline radiation, then the type
of feedline should not matter. Answer: vertical polarization.

With all due respect, the standard TNC, and the BNC use the same shielding mechanism. Except for the screw vs bayonet, they would connect to each other just fine. They are really the same connector on the inside, where it counts, and have the same RF leakage characteristics.

There is a high performance version of the TNC that uses a non slotted shield connection that is good to somewhere in the 10's of GHz, but it is extremely expensive, and not in common use.

The TNC has some advantages over the BNC. It has no spring in its mechanical coupling, and as such it is more rigid. It is waterproof. It comes with an option for being safety wired to its socket. In general, a TNC will take a lot more abuse than will a BNC.

If you are having trouble with your BNC's at 1GHz, you probably need to find a new supplier. Amphenol's and Kings, will work just fine.

That's what I would do.

>Next question is whether I run coax from the antenna or use 300 ohm
>twinlead.

I would use coax. Best would be the double-shielded RG-59. The
outer shield is braid and the inner shield is foil.

>Final question -- should I just install a high pass filter from the
>start, or wait and see if there are any problems?

Sounds like you have an ideal opportunity to eliminate any potential problems
before they occur. I would go ahead and install a good high-pass filter.
Mount it right at the TV antenna terminals. It would also be a good
idea to install a common-mode choke. One good way to do this is to
use a twin-lead-type high-pass filter with twin-lead-to-coax balun
adapters on both sides.

3323. Feedback to Operating Practices

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-29 20:01:26 UTC
From: tonyp@convex.com
Message-ID: <1992Sep29.200126.16371@convex.com>
Source record: 284697

I've received quite a bit of E-MAIL from my posting (complaining/pointing out) operating practices.

One new feller sent me the following set of questions. I answered 'em all, correctly of course [ahem!], but asked his permission to post it to the group so he could get some well rounded feedback too.

I have mixed feelings to the recent comments about "operating procedures". I am a new ham. Got my novice late June, and General early September.

For equipment, I have an HF transceiver, and a borrowed 2m HT. I have spent LOTS of time listening, and very little attempting to make contacts. My log shows exactly 10 contacts (9 10m SSB, 1 10m CW). I haven't spoken to anyone on the HT.

The reason is that I am scared to death.

I want to sound like a "professional amateur". I don't want to get a reputation for being a "lid" early on! But comments like yours aren't entirely encouraging. I'm not sure if ham radio is a welcoming hobby, or a closed clique.

I've read lots of the books and magazines. I still have LOTS of questions. I'm aware of a resentment among some hams toward codeless techs, so I started with Novice, so I could avoid getting a "N1xxx" call. In my area, that means "probably a codeless tech".

Ok, maybe I'm oversensitive. But code and theory is easy, avoiding gaffs on the air appears to be difficult. By December, I may be the only "advanced" class ham with less than 20 QSOs under his belt!

Here are some questions:

1) Everybody on 2m seems to know each other already. How do I get involved?

2) There seem to be MANY repeaters in my area. If I use them, I should support them, right? but I can't pay dues to ALL those clubs. Are regular vistors welcome on open repeaters? How does this work?

3) Based on what I read, apart from real emergencies, there appears to be no valid use for an autopatch. True?

4) Apart from the fact that I'd be unwisely broadcasting my creditcard number, is there a reason why a long-distance credit card call is inappropriate for autopatch?

Does a long distance call violate the business use rule, as its furthering the business of Sprint or MCI?

5) I've heard a local "net" on 10m. I mean REALLY local, all within a 25 mile radius of me. They get on and exchange 1010 numbers and their own "net numbers", and talk about basically nothing. If I could join them some night, I'd DOUBLE my contacts to date !

How do I do this? Would I be welcome if I just dropped my call in during a lull?

Earth Satellite UARS Upper Atmosphere Research Satellite (NORAD #21701, COSPAR 1991-063B) was launched from Space Shuttle Discovery (mission STS-48) on September 15, 1991. It is measuring changes and ozone depletion in the stratosphere and mesosphere. This satellite is in an orbit inclined to the earth's equator by 57.0 degrees. It makes one revolution every 96.2 minutes and comes to within 575 km of the earth's surface and is most distant at 581 km.

UARS is measuring changes and ozone depletion in the stratosphere and mesosphere. It is beginning a sequence of evening passes for North American observers.

UARS is roughly a sphere 4.6m in diameter and 9.8m long. It has 6 - 1.5m by 3.3m solar panels. I have observed UARS from Denver 4 times since its launch once at +3 mag and another time at +1.

3326. Help write a Procedures Manual

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-29 21:10:11 UTC
From: tonyp@convex.com
Message-ID: <1992Sep29.211011.20367@convex.com>
Source record: 284701

Re: My OPERATING PROCEDURES posting.

Responses were excellent. Most were in complete agreement with me - :-)

A few new-timers as well as old-timers suggested that I write an article.
(why, even a couple of people at ARRL HQ!)

This has given me an idea:

Send me / post your operating procedure likes & dislikes. I'll compile
them and maybe one of you silver-tongued devils can fine-tune it into
a "finished product".

When everyone is happy with the results (give or take a few) maybe we
can submit it [and call it public domain] to the various publications
that are oriented towards "getting started in ham radio".

This is our hobby. No one is running it, and telling us how we gotta
do it. This is your chance to make your feelings heard. Next time you
tune around and get cranked off, don't just sit there and sizzle: send
me something!

ARRL used to have this neat 8-10 page book for novices, back in the 1960's.
I vaguely remember a couple of lines in it: it started out something like
"You old timers - go look at the HOW'S DX section or something. I want to
talk with the new guys..." then there was a part something like "when you, Bill
Novice fire up your rig, it is a good idea to turn the receiver on before
you beginning honking out a CQ". Also, another line went something like.
"Your receiver has a tuning knob - use it! It keeps corosion from setting
in. You also might find a station calling you off frequency". This was a
great book. We'd laugh about it for hours at the club meetings, and we
read it so many times that we "became" it.

AP>My IC-735, still under warranty, has picked up the strange habit of
AP>starting scanning from 14.0 MHz in the vfo no matter where in the
AP>vfo you are when you tell it to start scanning...

AP>Anyone know if this is common in these rigs or what? Is it something
AP>to do with the microprocessor?

Well Andrea, I too have the 735 and have not had the problem you
describe. Since your 735 is still under warranty, have it looked at by
all means and DO NOT accept it back until it works to your satisfaction,
not ICOM.

>else. Does anyone know of any way I can do this?
>

Not at present. Recognizing that many Amateur Radio operators would
very much like to have special callsigns again, both the ARRL and
the FCC are striving toward that goal -- some day down the road.

At the present time, however, since your Dad's no longer able to
perform the control operator functions required of him, his callsign
may not be utilized.

We intend to continue working on ways to make special callsigns
become a reality once again.

> ---
>

To the 'feller' who sent "honey bunny" the mail: Welcome to the hobby! And you're absolutely right -- it's really scary to get into a conversation on 2M repeaters sometimes, especially if you're a newcomer. But there are folks out there (and I like to think I'm one of them) who will welcome your arrival. You're in luck -- the "nice folks" outnumber the idiots. (though unfortunately, one idiot can ruin your whole day...)

> [...]
>
> 1) Everybody on 2m seems to know each other already. How do I get
> involved?
>

Believe it or not, once upon a time, we were all strangers. But one by one, we got up the courage to put our callsigns out on the repeater every now and again, and eventually one of the "locals" noticed us and struck up a conversation. Eventually they got used to us, remembered our callsign and the name associated with it, and even got to be friends.

The best way to get involved is to pick up that HT, screw up your courage, and say "N1xxx listening" (or probably KA1xxx in your case, since you started as a novice).

Perhaps nobody will answer. That's entirely possible. But that probably means that either nobody's listening to the repeater now, or else whoever is listening isn't in the mood for chitchat with a stranger just yet. This happens. But don't let it discourage you! Keep it up! That's not to say you should put out your call every minute or so -- that's a bit much. But every couple of hours (to take advantage of different people's listening hours) or every day at the same time (to get people "used to you", as it were) would be great. Eventually, SOMEBODY will come back to you. With any luck, it will be somebody who recognizes that your call is relatively new, and will say "welcome to the hobby!". Voila -- a QSO is born! Introduce yourself, say you're new, maybe even say you're a bit shy about this stuff. It gets easier, trust me...

Another way to get involved is to check into 2m traffic nets. As a general rule of thumb, you should listen in on several nets before checking in, just so you know how the net works. Then on the day you figure you're ready, wait for the Net Control Station (NCS) to open up checkins to stations with or without traffic, and then follow the given check-in procedure (generally say "here is", then unkey for a second to see if anybody else was saying "here is" at the same time; if it sounds clear, continue on with "KA1xxx, no traffic". Emergency nets will also want to know your power source, either commercial or battery). If the NCS doesn't recognize your call, you may be asked to give your name and location for the net's records. If you check in often enough, the regular NCS's will get to know you, as will all of the regular folks on the net, and starting up conversations with folks who think they know you is lots easier after that. And who knows -- maybe you'll find traffic handling fun, too!

> 2) There seem to be MANY repeaters in my area. If I use them, I
> should support them, right? but I can't pay dues to ALL those
> clubs. Are regular vistors welcome on open repeaters? How
> does this work?
>

Well, the definition of an "open" repeater is one that anybody is welcome to talk on, whether they "belong" or not. And not all repeaters are operated by clubs, either. The one in my town (146.655 Clinton, MA) is owned by the local Civil Defense agency, and is open to use by anyone in the area at any time (with the caveat that, should there be some civil defense emergency that requires repeater use, all other users will stand by until such time as the repeater is opened for general use again. But that's mighty rare in these parts). There are no "dues"; we who are involved in the Civil Defense agency take care of the repeater, but we don't have to pay to join up...

And as far as clubs themselves are concerned, that's a good way to meet people, too. Just about all the clubs I know about welcome newcomers to sit in on a few meetings of the club before joining, just to give you a chance to see if the "atmosphere" of the club suits you. If you like it -- great, maybe you'll join! And if not, well, at least you got a chance to meet some of the local hams face-to-face, so when you hear them on the local repeater, you can say "thought I'd say hello, we met at the last club meeting". There's no rule that says you have to join every club you visit (heck, there's no rule saying you have to visit every club you join, either -- I have a friend who joined our local club last spring just because he liked the folks who hung out on the repeater!)

And, failing any of the above, if you happen to see somebody here on the net whose address looks local to you, drop them a note, introduce yourself, and set up a schedule on the local repeater for later... :-)

73, and if you're in the Clinton neighborhood, give me a shout on 146.655!

In my shop, we've been replacing twist-on BNCs with crimp-ons. The twist-on connectors are fine, until you go to move the terminal and drag it around with the connector still attached. Twist-on BNCs were responsible for half of our failures before we started replacing them.

READ the manual!!!! The beginning scan frequency is the one in the NEXT
TO LAST in the memories. The scan stop frequency is the one in the LAST
memory channel. No matter where you are on either VFO, it will start and
stop on those two frequencies. If you want to change the start and stop
frequencies of the scan, change those two frequencies in the last two
memory channels.

You can be tuned on ANY frequency but the scan is not conntrolled by the VFO.
I know ICOM's instructions are a little hard to follow, but if you follow
them CAREFULLY you will succeed. I know, I used to own a 735.

Glad to see that you found a good connector.

Unfortunately, my experience has been the exact opposite. Crimp-on
connectors especially, and twist-on connectors to a lesser extent,
have been the cause of at least 90% of the problems with our 10Base2
Ethernet. (No, it's not a feedline, but it's RG-58/U with BNC
connectors on the ends...) Somebody moves their workstation, they tug
on the cable, and the connector falls off. And the entire segment
goes down.

>her antenna at the far end of her house to keep it as far away as
>possible from my antennas, even though the feed line becomes much
>longer. Is this true?

Pointing through your antennas is NOT GOOD (tm). If you can possibly
shift the mounting point to look beside your antennas rather than
through them, do it. This is more of a ghost issue than an RF pickup
issue if you operate HF. The TV beam has no gain at HF. You want the
antenna as far from your near field as possible, but the near field
of a transmitting antenna extends out more than a wavelength at the
transmitting frequency. So you'd like to mount the TV antenna at least
80 meters from your antenna. That's not practical in your situation
so just mount it at the best physical location and try to avoid ghosting
caused by the metal of your antennas.

>Next question is whether I run coax from the antenna or use 300 ohm
>twinlead. I feel that the coax will be more resistant to the RF
>from my transmitting, but will have higher loss than the twinlead,
>especially for the UHF. I don't have any experience with TV
>twinlead -- will that pick up TVI? What is best for this situation?

Properly mounted twinlead is no worse than coax for picking up
unwanted HF radiation. The balance of the lines should cancel
differential currents and leave you to deal with common mode
currents. Proper installation can be difficult, however. Coax
will be subject to common mode currents as well, but is physically
easier to mount. Twinlead has lower loss at TV frequencies than
coax, but since your neighbor uses rabbit ears now, that's not
a concern. Use coax.

>Final question -- should I just install a high pass filter from the
>start, or wait and see if there are any problems? The reason for
>installing from the start is so if it causes some drop in signal
>that isn't noticed later. I haven't experimented with any of these
>so I don't know how much attenuation they provide to the signal they

>should be passing.

Yes, include a good high pass filter from the start. Be careful here, many high pass filters for coax on the market don't break the common mode path and are worthless. A trick I often use is to get a high pass filter for *twinlead* and install it in a coax line using baluns. This breaks the common mode path and offers high pass filtering. A really cheap way to do this was posted recently. Simply attach a balun to each of the cables and about 2 feet of twinlead to each balun. Now tape the twinleads side by side to each other. There will be enough coupling to pass TV signals, but HF won't get through.

>I don't think they are experiencing many problems now, but I suspect
>that I'll be be getting on the air more once I finish up this antenna
>work. I believe that 80 meters is causing most of the TVI that I
>do generate, possibly due to high SWR.

High SWR has nothing to do with TVI in a properly engineered system. The devils you want to control are fundamental overload and harmonic generation. Make sure your antenna and not your feedline is doing the radiating, this is a matter of balance. Make sure there are no rectifying junctions in the near field. Use a low pass filter, a properly designed transmatch can serve as a low pass filter. Don't care about SWR on your feedline, care about matching the impedance to the transmitter. That's what transmatches are for. Use a good RF ground system or a counterpoise to maintain balance.

Most hams would be better off if they threw their VSWR meters away and concentrated on the fundamentals of antennas and feeders. It's easy to get a low VSWR reading with a lousy antenna system, and it's very possible to have an efficient clean antenna system that shows a very high VSWR.

>seal against the top rim of the jack.

Neither of these connectors is really weatherproof. The use of silicone
grease and either heatshrink or self-vulcanizing tape is mandatory on
outdoor connectors for a professional installation. BNCs are worse than
Ns because the threaded connection can resist water better than the
bayonet connection, but water *will* seep into either given time. This
is mainly a problem at higher frequencies where just a little water,
less than a drop, will make the connection lossy. Water wicking into
the braid through a connector/jacket leak is less of a problem with
connectors that employ a rubber sealing gasket, if it's installed
properly, but it isn't foolproof. It's good policy to always coat
a connection with silicone grease and seal it with heatshrink or
self-vulcanizing tape, not electrical tape. If you do this, then
crimp connectors are just as waterproof as the fancy Amphenols while
being cheaper and easier to install.

In our 2 GHz microwave links used by our live trucks, we've quit using
anything but Kings crimp connectors. They have superior mechanical
strength and take only seconds to install properly. With the proper
protection, they last for years. We've never had an unprotected connector
last through more than a couple of rainstorms, even the prissy Amphenols.
Installing an Amphenol connector is an exacting process that is very
tedious. Getting good mechanical strength out of such connections is
a hit or miss affair. You can swing from a good Kings connection on
RG9, I wouldn't try that with an Amphenol. (not a recomended practice

in any event, but it does demonstrate the mechanical strength of a good crimp connection and news monkeys are very heavy handed)

Message-ID: <9209300450.AA00223@ucsd.edu>
Source record: 284720

I just found 10M FM. I wonder if my colleagues could answer a few questions? It seems the 4 repeater channels are active as well as 29.600 simplex. I also heard some stations at 29.500 and as low as 29.100. Have they abandoned the OSCAR subband? It seems that there is some simplex activitity between 29.3 and 29.5.

I'm also curious if Novice/Tech plus hams can operate FM from 28.3 to 28.5. It seems they have voice privledges here but I don't see where it specifies mode. Since narrow band FM is allowed to 28.3 can N/T operate FM here?

Any help on simplex freqs other than 29.600 would be appreciated.

Thanks for your help.

3342. Periphex NiCad batteries

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-30 05:07:37 UTC
From: morris@grian.cps.altadena.ca.us
Message-ID: <1992Sep30.050737.12309@grian.cps.altadena.ca.us>
Source record: 284719

Glen asked for info on experience with Periphex:

SHIERY@FULLERTON.EDU (GLEN SHIERY) writes: EDITED

>Has anyone had a problem with the Periphex brand batteries that are
>advertied in QST.

>I bought a BP-84S 18 months ago that has failed.
Is it in warranty? If so, send it back with a copy of something dated
even a copy of the check you paid for it with. I had one in-warranty
fix and had no hassle. See below.

>failed 6 months after the warranty expired. I hope that this is an
>isolated problem. If so, I will buy another. Periphex's advertising
>sounds great, so far though my experience is less encouraging.

My experience with Periphex has been a couple of Yaesu inserts, a
oversize battery, and several Icom inserts that I've given as
presents.

My Yaesu 4SL oversize battery for my 727 has been back 3 times:
The first cuz one of the 'ears' broke off the battery when I dropped
it from 2 feet onto a concrete floor (with no leather case).
Interestingly they replaced the insert too - I know because I made
a hidden mark on each cell; 11 months old.
The second time it went back was when a cell shorted (verified by a
voltmeter - exactly 1.2 volts low). This was 4 months after I got it back
after incident #1. This was a warranty fix, even though I had bought
it over a year ago. Maybe because it was a new insert?
The third time was about 14 months later - it broke an ear off again
two weeks before Labor Day weekend.
This time I sent them an idea on how to modify the mold the cases
are made from to totally prevent this failure mode. I've had it back
now for about 6 weeks. Let's see if it lasts.
Let's see if they have a NIH problem about the case design.
I don't know if they changed the insert this time when they put the
insert in a new case. I marked the cells again but don't plan on opening
this case until it fails - either physically or electrically.

Of the 4 Icom inserts I've given away (3 BP-8Ss, 1 BP7S), I think all are
still in service (at least I haven't heard any complaints).
The oldest is 3 years, the newest is 3 months.

Lastly, when I sent the 4SL back the last time, I ordered two Yaesu
FNB-4 inserts. I called the 800 order # to get the total amount, and
asked that when the order and the check was received that the inserts be
mailed immediately, and the 4SL when it was fixed, as I was leaving on a

Labor Day weekend trip the following week, and would like to haveextra good batteries with me (at that time, I had 4 batteries, two were dead - hence the order for inserts). The lady said "no problem"...
Two days after I got BACK from the trip, the 4SL and new inserts arrived: One Yaesu FNB4A insert, one Icom BP-8S insert.

Anybody wanta buy a BP8S insert (fits a standard BP8 case, 1.2AH , rapid charge)? I paid $46.00 and it's still in the sealed bag.

Lastly, in case anybody is curious, the common Yaesu failure mode is broken slide ears on the top of the battery. Where the Icom battery has a metal slide assembly screwed to the top of the plastic case, the Yaesu has the slide molded into the top of the radio. Oversize (read: heavier) batteries tend to break the slide off the top of the case.

I'd be interested in any other experiences with any battery supplier.

Hello,

What follows is the collection of Kenwood TM-741/732 mods that I have collected over time. I'd like to hear from anyone who has additions and/or corrections to this list.

Some time back someone posted a message asking if there would be any interest in creating a kind of 'super-manual' for the 741. I replied to this person, but never heard back from him. If I get enough interest; I may consider doing a project like this myself.

If you have any mods, tips, owner's manual corrections, or other information that you think would be useful in a 'super-manual' like this, please let me know or forward a copy of the information to me. Also, if you're interested in helping out with creating the manual, please let me know.

Here's my list of mods. Some of them I've made to my readio. Some I have not. Please let me know what is missing or needs changing:

MODIFICATION MATRIX FOR TM-732A

Resistors TX Ranges STD Has
M 22 21 20 19 VHF UHF SHIFT 800 Remarks

K1 0 1 0 1 144-148 438-450 .6/5 Std. US Version
K2 1 1 0 1 144-148 438-470 .6/5 x US After green wire cut
K3 1 0 0 1 142-152 420-470 .6/5 x MARS/CAP Mod
K4 0 1 1 0 136-174 410-470 .6/5 x All Band Mod
M1 0 0 0 0 144-148 430-440 .6/5 Generic Int'l Model
M2 0 1 0 0 136-174 410-470 .6/5 x All Band Int'l (430 default)
E1 0 0 1 0 144-146 430-440 .6/(1.6) Std Europe Model
E2 1 0 1 0 136-174 432-438 .6/1.6 x Denmark
E3 0 0 1 1 144-146 410-470 .6/(1.6) x
E4 1 1 0 0 144-146 430-440 .6/(1.6) x
E5 1 0 1 1 136-174 410-470 .6/(1.6) x Europe All Band
C1 0 0 0 1 136-174 340-512 5.7/10 China Model

0 = Resistor IN 1 = Resistor OUT

Notes:

1. All "resistors" O ohms (wire jumper OK)
2. Green wire is equivalent to R22 - present in K1 model
3. 0 = resistor present, 1 = resistor absent
4. Standard shifts in MHz. Those listed as (1.6) also do -7.6
5. Codes not listed are used in Japan version, special CPU required
6. M column is factory MODE number

7. K2 Mod includes 410-470 RECEIVE and enables CLONING features

To perform any of these mods, remove the back cover from the remote head unit. Resistor numbers clearly marked on board along top.

800 MHZ RECEIVE

To enable 800 receive, switch to UHF VFO (not available in UxU), press and hold MHZ button until 800.000 appears.

A capacitor must be added (C348) to enable the 800 receiver. To add, remove UHF transciever board and next to the pad of pin 1 of IC-202 (on the foil side), add a 2.2 pF chip capacitor. A wire can be used instead of the capacitor but sensitivity will be reduced. (See schematic diagram for reason).

HARD-WIRE CLONING (Works in all confguration modes)

This procedure allows you to clone the entire memory of a "master" transciever into the memory of a "slave" transciever.

First, construct an RJ-45 Jumper cable as follows:

```
------| |------
UP ---------------------------- UP Note that PTT and DOWN
E ----------------------------- E are crossed end-to-end
PTT ---------------------------- DOWN
DOWN --------------------------- PTT
------| |------
```

For hacker's reference: UP=CLK, PTT=SO/, DOWN=SI

1. Configure the master transciever's memories as desired.

2. Switch power OFF, hold down F and MHZ keys and switch power back on while holding keys. Display will show "CLonE".

3. Set the slave transciever in the clone mode (as in step 2).

4. Plug the cable into the two radios (which end does not matter).

5. Press the CALL button on the master. When "End" is displayed, operation is complete.

ON AIR CLONING (Does not work in K1 or E1 Mod modes)

This procedure allows you to clone a second transciever as above, over the air. The data is transmitted automatically using DTMF tones. During transmission (which is one-way only), the master will automatically switch to LOW power. To be legal, use only a UHF cloning frequency.

This procedure is not enabled in the stock transciever. At a minimum, you must cut the green wire to make it work.

1. Configure master transciever's memories as desired. Select
a UHF simplex transmit frequency and set PTT to UHF (will work on
VHF but is not recommended).

2. Switch the power OFF. Press and hold the CALL and DTSS buttons
and turn the power back ON. "CLonE" appears in display.

3. Set the receive frequency on the slave transciever the same
as that of the master. Turn power OFF, hold down CALL and DTSS
keys and turn power ON. "CLonE" appears in display.

4. Press the PTT on the master's microphone. Data transmission
will begin. In case of a receive error, the slave transciever will
display "Err". When the procedure is complete, both radios will
display "End".

THE FOLLOWING FEATURES ARE UNVERIFIED, SO
YOU MAY NEED TO EXPERIMENT FOR YOURSELF

PAGING ANSWERBACK (Does not work in K1 or E1 Mod modes)

The exact operation of this feature is unclear but the following
description has been given:

1. To enable, hold down the F key and press the TONE key.

2. Do disable, repeat step 1

When enabled, documentation says: "If a matching code is received
and the other transciever is no longer BUSY, the code of the local
transciever is sent to the other transciever. The answerback
function then turns off."

MEMORY RECOVERY (requires DTMF microphone)

(Documentation of this "feature" is difficult to comprehend but
perhaps someone will figure out what it does.. I suspect that
"RECOVERY" refers to returning the memories to their original
state after changing the split memory layout.)

1. Hold down F and C.SEL, turn on power

2. Press D, followed by 7 on the microphone. "Inspection Mode"
is now enabled.

3. To cancel, press and hold F and then C.SEL

"Note: Before recovery, the memory channels must be returned to
the previous state (number of split memories, etc.)."

MODIFICATION COLLECTION FOR THE KENWOOD TM-741A TRI-BANDER
==========

TM-741A/E FREQUENCY EXTENSION
==========

Phase 1
----

a) Slide the release knob on the front panel to the right
and remove the panel (be careful with the cable between
the panel and the main unit.)
b) Cut the green wire located in the left side (tape the
bare ends of the wire to prevent shorts.)
c) Switch the power on (a melody sounds to confirm the
change.)

Phase 2
----

a) Unplug the connectors of the cable between the panel
and the main unit.
b) Remove the two screws on the rear of the panel and open
the rear of the case.
c) On the left side of the lithium battery there are four
jumpers marked R54, R55, R56 and R57 corresponding
respectively to b0, b1, b2 and b3 bits described below.

Set the four bits as required for your country:

- European Countries:
mode $05

b3 = 0
b2 = 1
b1 = 0
b0 = 1

- USA, Canada and Asia:
mode $03

b3 = 0
b2 = 0
b1 = 1
b0 = 1

WARNING: 0 => jumper set, 1 => no jumper.

d) Refit the rear of the case by reversing the order of
disassembly.

Frequency range after modification

|---|
		rx range		tx range		SHIFT
unit || min	max || min	max || EUROPE	USA CAN ASIA
------		-------------------------		---------------------------
28 || 18	54 || 26	45 || +/- 100 KHz	iden
50 || 40	90 || 46	76 || +/- 1 MHz	iden
144 || 118	174 || 136	174 || +/- 600 KHz	iden

```
| 220 || 215 | 260 || 215 | 235 || +/- 1.6 MHz | iden |
| 430 || 410 | 470 || 410 | 470 || +/-1.6,-7.6 | +/- 5 MHz |
| 1200 ||1100 |1400 ||1100 |1400 || +35, -6 MHz | +/-12,-20MHz |
|-------------------------------------------------------------|
```

TM-741A/E AM RECEPTION WITH 28 AND 50 MHZ UNIT
==

a) Press the [F] key, then press [BELL] key within
ten seconds. An A is displayed at the hundred-MHz
position to indicate AM mode.

b) To return to FM mode press the [F] again, then
press the [BELL] within ten seconds.

TM-741A/E 900 MHz BAND RECEPTION WITH 430 MHZ UNIT
==

Band change

To change to the 900-MHz band, select the 430-MHz
band, then press and hold down the [MHZ] key for at
least a second. Now 850.000 (initial setting) is
displayed.

To return to the 430-MHz band, press the [MHz] key
again for at least a second.

Adding a secondary 900-MHz dedicated antenna in the 430-MHZ unit
----

a) Remove the power supply cable from the power
supply or battery.

b) Remove the 430-MHz band unit with care.
For removal procedure see the INSTRUCTION MANUAL -
UNIT INSTALLATION, reversing the order of the
procedure and... using the brain!

c) Remove the shield plate (12 screws.)

d) Solder a coaxial cable (0.8 D) to the input
side of IC9 (center is alligned with the IC9,
ground at right side.)

e) Pass the cable throungh the notch and install
the shield plate.

f) Reassemble the main unit.

TM-741A/E MEMORY CHANNEL DOUBLING
=================================

Each band can be switched to the normal memory
(100 channels) and rear memory (100 channels). Each
band can contain 200 channels and... yes, a total of
600 channels can be used for three bands!

SORRY! This function can be enabled only by extending
the receive frequency (see bulletin #1 of this
FREQUENCYEXTENSIONSNEVERENDHISTORY.)

To switch the memory, hold down the [F] key and
press the [REV] key:

Normal Memory (100 ch) <--> Rear Memory (100 ch)

The functions of the rear memory are the same as the
normal memory, but memory channels are displayed as
follows (rather than 01 to 00):

A1 - b0 == 01 - 10 b1 - c0 == 11 - 20
c1 - d0 == 21 - 30 d1 - E0 == 31 - 40
E1 - F0 == 41 - 50 F1 - G0 == 51 - 60
G1 - h0 == 61 - 70 h1 - i0 == 71 - 80
i1 - J0 == 81 - 90 J1 - AA == 91 -100

TM-741A/E EXTENDED PAGING FUNCTIONS
==========

Preliminary

Cut the frequency extension jumper as described in Phase 1
of the bulletin #1.

Answerback function

Hidden function of the paging function.
If the answerback function is on, the code of the local
transceiver is automatically transmitted to the other
transceiver when the correct code is received to confirm
the code has been received.

OPERATION After the correct code is received, if there is
no BUSY signal, the code of the local transceiver is
automatically transmitted to the other transceiver.

ON/OFF To turn the answer-back on and off, hold down the
[F] key and press then the [CALL] key.

Automatic release function

Hidden function of the paging function.

OPERATION If the automatic release function is on, paging is
terminated automatically when transmission ends after

a call is received.

ON/OFF To turn the function on and off, hold down the [F] key and press then the [SHIFT] key.

TM-741A/E DATE DISPLAY FORMAT
==========

The normal date format is YEAR-MONTH-DAY. It can be changed to YEAR-DAY-MONTH.

a) Remove the front panel and locate R60 and R61.

b) Move R61 (that is below R60) to the left.

c) Repack the front panel with care.

TM-741A/E DC POWER DISPLAY
==========

Make the following change to display the SB line voltage on the memory channel section when the time is displayed.

a) Remove the front panel and locate R60 and R61.

b) Move R60 (that is above R61) to the left.

c) Repack the front panel with care.

Since the voltage of the SB line to the panel is displayed, it changes due to the loss caused by the wire and connector.

TM-741A/E HEADLIGHT LINKAGE DIMMER
==========

Make the following change to reduce the dimmer level by one step when the headlight is turned on (d4 remain unchanged).

a) Install DTC144EK on the panel printed circuit board (below R60 and R61).

b) Connect the load from the ILUMI pin of the panel printed circuit board to the 12 V side (where 12 V is output when the light is turned on) of the position light of the car.

TM-741A/E GAME MODE
==========

Simple games, such as a roulette game and a shooting game, and music can be played using the frequency display.

To enter game mode, hold down the [F] key and the [MUTE] key, and switch the power on.

1-2-3 is shown on the display. [BAND SEL A] selects Roulette, [BAND SEL B] selects Shooting, and [BAND SEL C] selects Music.

To return to game selection mode, press the [VFO] key.

To exit game mode, press the microphone key or switch power off.

Roulette Game
---

* When the roulette game starts, the display shows [000], the transceiver enters the receive mode with the power on, and the three digits begin to run rapidly.

* When the [MUTE] key is pressed, [000] on the display can be changed: [BAND SEL A] stop the leftmost digit, [BAND SEL B] stops the middle digit, and [BAND SEL C] stops the rightmost digit. Other keys are not accepted.

* if the three digits match, the LED and illumination lamp flash and sound effects are produced.

* if [123] is displayed, a fanfare sounds. If the [MUTE] key is pressed, game mode is exited and the transceiver functions normally.

Shooting game
---

* When the shooting game starts, your score is shown in display section A, and cannon balls, target and remaining cannons are shown in display section C, strating from the left.

* If the [LOW] key is pressed, the game starts. The "number" attacks from the left of display B. Take aim at the enemy "number" with the [TONE] key key, and shoot with the [MUTE] key. You win if 16 enemies are shot per screen. Thirty cannon balls can be used per screen. Each time you clear a screen, the speed increases. If eight screens are cleared, the first screen returns. The process is repeated.

Music

When the music feature is selected, [ENJOY SOUND PLAY] is displayed and the following tones can be produced:

MR = A MUTE = F
MHz = A♯ CSEL A = F♯
CALL = B BSEL A = G
F = C CSEL B = G♯
BELL = C♯ BSEL B = A
TONE = D CSEL C = A♯
REV = D♯ BSEL C = B
DTSS = E

DISPLAY TEST

Hold down F and MHZ while turning on power. This activates the display test mode where all segments and indicators are lit. Note the "ACC" indicator at the lower right. ACC is not defined in the manual, however I saw it come on once one night after I started the car with the radio turned on. The display lit up ACC and the UHF frequency display showed some sort of HEX code (a ROM checksum maybe?).

STRANGE TEST

(WARNING: YOU MAY LOSE SOME SAVED MEMORY DATA)

Hold down the F and MR keys while turning on power. The radio plays a wild sequence of tones and the displays go all crazy for several seconds. When it's done, everything seems normal except that the memory contents are reshuffled and some memories are duplicated. I can only speculate that this might be some sort of factory memory test...

UNDOCUMENTED TM-732A FEATURES

CLONE MODE

Hold down the F and MHZ keys while turning on power. The current control band will display CLonE. Pressing CALL initiates the data transfer, graphically illustrated by a moving S-METER display. No RF is transmitted during data transfer, instead it is assumed that the data is dumped out of the microphone port. Nothing more is known about this at this time.

AM DETECTOR CONTROL

The AM Detctor, which automatically comes on below 136 MHz, can be forced ON at any VHF frequency by pressing the F and MUTE keys while applying power. Radio continues to transmit FM but receives AM. Changing frequencies or memory channels will cancel the forced AM mode. This capability could be useful for listening to the USAF Thunderbirds which sometimes operate in the 143 MHZ band using AM.

These are all of the mods that I currently have (I think). If anyone has any corrections or additions to this list, please let me know.

I'd like to put together as complete a list of the mods for the TM-741 as I possibly can....

Also, I've seen several references to the TM-732. Is this the same radio (as far as being able to do mods) as the TM-741? I can't seem to find any kind of a good description for the 732. Does anyone know of any mods for the 732 that will NOT work for the 741?

Thanks,

In the info-hams mailing 'somebody asked:
****

Date: Tuesday, 29 Sep 1992 16:36:34 CDT
From: sdd.hp.com!ux1.cso.uiuc.edu!bert.eecs.uic.edu!uicvm.uic.edu!u12566@network
.UCSD.EDU
Subject: RTTY and a PC
To: info-hams@ucsd.edu

I am looking for info on how to hook up a PC and a receiver to
decode RTTY transmissions. The equipment in question is
an IBM clone and a Drake R4C.

Thanks for any advice.
****

There is a nice program for the PC named CODE-3 .
This program can decode RTTY and MANY other protocols and codes.

Are you working in HP? Where is sdd.hp.com and what is your name.

3346. Feedback on Operating practices.

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-30 09:42:21 UTC
From: pjml@swmis.nerc-swindon.ac.UK
Message-ID: <9209301041.AA06222@swgen-t>
Source record: 284727

If you want to listen to proper operating practises in use, try air
traffic controllers or MARS traffic-handling nets.
I regularly run a net with some 200+ stations concurrently active; its
pure bliss compared with listening to a pileup on 20 meters (which sounds like
the baying of the Hounds of Hades, and does nothing to promote a view of
the ham bands as something worth protecting from commercial poaching...)
A ham i used to know (G3HRN) had a sticker on his rig; he got it when
his employer had been trying to cut down on unnecessary phone calls; it said,
in big red letters:-

IS YOUR CALL REALLY NECESSARY?

The motto being, listen, listen, listen! You sure as hell wont work 'em
if you dont hear 'em first.

While the masses are QRMing each other on a pileup frequency, they are leaving
other slots for *you* to work on. OK you may not work 'the latest' DX, but
you may get to have quite a few contacts.

>One new feller sent me the following set of questions. I answered 'em all,
>correctly of course [ahem!], but asked his permission to post it to the
>group so he could get some well rounded feedback too.

Okay, this is for that anonymous new feller (not all that much newer than
I am, actually):

> I have mixed feelings to the recent comments about "operating
> procedures". I am a new ham. Got my novice late June, and
> General early September.

Congratulations, and welcome! It's been my experience that 99.99% of hams
are glad to have newcomers, and won't think any less of you if you make a
few mistakes at first...provided, of course, that you don't come across like
you know everything and they know nothing. And that fraction of a percent
of them who *don't* accept you, aren't worth worrying about.

BTW, I think we all make a few mistakes in the beginning. I had trouble
remembering my call sign at first. Kept getting it confused with my father's
(KB2OOA vs WB2ODU) since I've known his call for years. Now I've got a new
call (AA2KZ) and I have to remember not to say AA2JT (my OM's call). Kinda
like remembering your own phone number, I guess... :-) And I'm sure I could
think of a couple other things I've messed up, but I'm getting there...

> I've read lots of the books and magazines. I still have LOTS of
> questions. I'm aware of a resentment among some hams toward
> codeless techs, so I started with Novice, so I could avoid getting
> a "N1xxx" call. In my area, that means "probably a codeless
> tech".

That's exactly what I did! Mostly cause I wanted to avoid the codeless tech
stigma, and partly cause I knew I'd get the ticket back faster if I sent the
610 to Gettysburg myself.

> Ok, maybe I'm oversensitive. But code and theory is easy,
> avoiding gaffs on the air appears to be difficult. By December, I
> may be the only "advanced" class ham with less than 20 QSOs under
> his belt!

I doubt it. I don't have records of my 2m repeater QSO's, but on HF, I don't
have many more than you...and I just got my Extra recently.

> 2) There seem to be MANY repeaters in my area. If I use them, I
> should support them, right? but I can't pay dues to ALL those
> clubs. Are regular vistors welcome on open repeaters? How
> does this work?

They're certainly welcome on ours. Unfortunately, it's down here in 2-land. I would second the suggestion made by another poster: Visit and/or join one (or more) local clubs. You'll make friends in person, which makes it a whole lot easier to make contacts on the air. (I can talk up a blue streak with someone I know, but I still have never just gotten on and announced "AA2KZ listening...")

> 5) I've heard a local "net" on 10m. I mean REALLY local, all
> within a 25 mile radius of me. They get on and exchange 1010
> numbers and their own "net numbers", and talk about basically
> nothing. If I could join them some night, I'd DOUBLE my
> contacts to date !

> How do I do this? Would I be welcome if I just dropped my call
> in during a lull?

That probably varries from net to net. I belong to one Old Pharts net on 75m (what can I say, my father is one of the Charter Old Pharts - I had no choice!) where anybody is welcome. Once you check in the first time, they give you a Net Number that's yours for life, whether or not you ever come back. (In other words, there's no escape!! :-)) Granted, some of their practices would make the purists cringe, but it's a great way to get up your nerve, and your number of contacts, since they're on every night. (The Maine Potatoe Net, 3953KHz, 8pm local Eastern time.)

Drop me some email if you'd be interested in setting up a QSO some time. I promise, no flames if you make a mistake...but you probably won't. It seems to me that attitude is the main thing: a conscious effort to do things "right" and a willingness to learn. (At least, it's worked for me, so far.) And you seem to have that part down just fine!

Their rules say this but it is only their policy - not always the case,
and certainly not law.

>sign and keep it in my family, instead of it being re-issued to someone
>else. Does anyone know of any way I can do this?

Your congressperson has a large staff devoted to "constituent service"
for items like this. You should probably mention in your letter to the
congressperson that the FCC has been making exceptions to the "rule"
when it cares to (the recent issue of K3VOA? to the Voice of America
ham radio club is a good example) so they have the machinery in place to
accommodate the request. The congressperson can provide the motivation.

3349. Winter's Almost Here, Hooray!

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-30 13:20:43 UTC
From: n2gj@phsbbs.princeton.nj.us
Message-ID: <9k2wRB1w164w@phsbbs.princeton.nj.us>
Source record: 284671

Last night 75 meters was hopping. Many strong DX stations were heard here in NJ on a lowly G5RV at 45 feet. The "best" DX was a 7X4 from Algeria heard about 55 in the so-called DX-Window from 3790-3800 kHz.

Just a reminder: as we move into the winter DX cycle on HF, please try to refrain from having the typical local ragchew full-bore amplified chats in this DX window. It's very frustrating to those of us limited to basic exciters/receivers and cheap antennas! Also keep in mind that many of these DX stations use "split-frequency" operation, transmitting on one frequency while listening on another. It's quite exasperating to hear the lids screaming on top of the guy when he's sending your report on the frequency he's transmitting on, and you're sitting there on practically a clear channel. In short, it pays to LISTEN FIRST! Find out what's going on, follow the callouts on the local Packet DX Cluster, and follow the example of the good operators who seem to know what to do!

Enough of my soapbox. Good DX hunting to all. Best 73,

There is no way to do this.
You don't have to worry about it being reissued, as they are not reissuing calls to anybody (hence the reason you couldn't get it either). With the exception of the WN-series call, I don't think the FCC has ever reissued a call except by request (back when they were willing to take those requests).

Message-ID: <1acar7INNm7n@topaz.bds.com>
Source record: 284636

You'll need what boils down to a special "modem." You will also need software (or hardware) to shift from the 5 bit (baudot) RTTY codes to ASCII that your PC generally wants. Perhaps the easiest way to accomplish this is to buy a RTTY Terminal Unit. Typically these things are RADIO AUDIO IN->RS-232 out things. You used to be able to find RTTY only versions of these (you may still at hamfests) but they've been pretty much replaced by the Multimode TNC's such as the AEA PK-232. These units do Packet, RTTY, AMTOR, and to a lesser extent FAX and MORSE decoding.

RTTY isn't all that hard to demodulate, it's just a tone that varies typically 170 Hz. I've seen little cheap RTTY demodulators in RS-232 shells (probably just a PLL) and then software has to do all the work. Look in the back of the scanner mags.

I have a PK-232, the tuning indicator on it, is however a big help. If you ever do decide to go ahead and get your license, then the PK-232 will probably be adequate for you a long while.

> I passed my test two weeks ago. How long does it take?

Someone should place this in the FAQ list. Somewhere between 4 and 6 weeks. It depends on three factors: How soon the examiner sat on the form before he sent it to the VEC (he's allowed 10 days), how long the VEC took to process it and send it to the FCC, and how long the FCC has to process it. It seems to me that the FCC takes sometime between 2.5 and five weeks to process things (note they also operate on a weekly schedule so theres another +- 1 week error there). The ARRL has done a lot in the last hear or so to greatly speed up everything else on exams they coordinate. This includes streamlining their operation as well as providing account numbers on a variety of overnight express companies to the examiners to return the paperwork from the exams.

I typically give exams on Saturday, I try to send in the stuff on the following monday (which means that I usually send a good chunk of the weekend going through 100 exams and their paperwork). I take pride in the fact that It's been a long time since I've gotten an exam returned due to a processing error. We carefully check all the signatures and information on the 610 again before sending them up to the league (separate from the exam sessions). I usually get the "All OK" postcard from the league back by that friday (regular mail!).

Message-ID: <1992Sep30.141607.3853@cbfsb.cb.att.com>
Source record: 284725

I need to be able to paint a Collins rig (312B4 power meter) with the original color and finsih. I bought a can of paint from Surplus Sales of Nebraska ($12 !!) that was supposed to be the real thing, and the color was a good match but the finish was satin instead of glossy so it doesn't look good next to other Collins equipment.
The Collins finish is glossy and very hard - almost indestructible.
I'd appreciate any info or experience you may have had with painting your Collins gear.

You go out and *buy* the proper Kings crimp tool ($105) and the proper die set for the connector you're using ($35) and you never have a problem again. The secret to crimp connectors is to quit using those #$%& gas pliers to crimp them on and do it right. No the Radio Shack crimp tool won't do, it isn't worth spit. It takes the precision machined die set to make a 300 lb connection. The military likes crimp connectors, NASA likes crimp connectors, you will too once you start putting them on with the proper tool.

A friend bought an old HW-101 with both SSB and CW filters intact but the little lever knob for the filter switch is missing. I know they are special but does anyone have one they will part with? This friend is a new advanced class who hasn't yet been on the air although he has been licensed nearly a year. I just bought a Hallicrafters S40-B at the AWA antique conference currently under way here in Rochester. The seller said it could use an alignment but he and I both lack documentation. Can anyone help? Copying and postage fees will be provided.

From: milewski@oregon.uoregon.edu
Message-ID: <1992Sep30.152710.21071@nntp.uoregon.edu>
Source record: 284634

Never having a good DX antenna for 80 meters (only a ground mounted vertical so far) I'm working on getting at least some sort of a wire antenna up about 60 - 70 feet.

I'm considering ordering the Superloop from RadioWorks. It seems to fit short term plans at this time.

My main question is this...

What would be the best orientation for the antenna? Broadside East and West OR North and South. I'd like to maximize the amount of DX countries I can work in an attempt for 5BDXCC. Not knowing the propogation paths most prevalent on 80 meters, I'd appreciate any experienced suggestions!

Thanks,
Steve

I remember many of the same complaints being voiced when I became
a ham in 1962. The old-timers complained that them young whippersnappers
just didn't know what good operating procedure was and that the hobby
was going downhill fast.

While I agree that there has been a noticeable degradation in the "class" and level of
proficiency of operating procedure on average these days, I believe that we
should not forget that every generation thinks that the one after it
is going to hell in a handbasket.

3360. KENWOOD TS530S TO HAMTRONICS TRANVERTER INTERFACE

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-30 16:10:34 UTC
From: bourque@sceng.UB.COM
Message-ID: <9209300908.A31708@sceng.ub.com>
Source record: 284647

Tom writes in response to my posting:

>IF YOU CHECK THE MANUAL YOU WILL SEE ON A MULTI PIN CONNECTOR ON THE
>BACK OF THE 530S THERE IS A TRANSVERTER OUTPUT. TO DISABLE THE FINALS,
>TURN THE SCREEN GRID VOLTAGE OFF AND THAT WILL KILL THE FINALS.....

>CHECK THE MANUAL! THERE IS A TRANSVERTER OUTPUT!!! I'VE SEEN IT!!
>THE TRANSVERTER OUTPUT TAKES THE DRIVE OFF THE 12BY7A DRIVER.... IT
>IS STILL A LITTLE HIGH, BUT A SMALL ATTENUATOR CAN HANDLE IT. KENWOOD
>HAS ALWAYS DESIGNED A TRANSVERTER INTERFACE IN THE TS-520(S), TS-530S,
>TS-820(S) AND TS-830S RIGS..... i KNOW, I HAVE OWNED EVERYONE OF THEM
>AT ONE TIME OR ANOTHER.... I OWN TWO 830S RIGHT NOW AND THEY HAVE TRANSVERTER
>INTERFACES..... SO DO THE 530S.....IF YOU READ THE MANUAL YOU'LL SEE IT!

>Tom

OK Tom, I did check my manual and there is no OBVIOUS transverter
interface shown. Two multi pin connectors exist. One as EXTERNAL VFO
and the other as REMOTE. Both defined as follows
PIN# EXTERNAL VFO REMOTE
1 VFO SIGNAL RECORD OUTPUT
2 RELAY CONTROL RELAY COMMON
3 +9V PTT LINE
4 CW FREQ SHIFT RELAY N.O.
5 VFO CONTROL RELAY N.C.
6 DISPLAY CTRL ALC INPUT
7 GROUND NO CONNECTION
8 +12V

OK Tom, Which of these signals do you think is the transverter
output????
Your reference from the 12BY7A driver is a good place to make a mod.
Thanks for the tip. The signal called DRV (from the schematic) does
NOT go to ANY connector on the rear of the TS-530S. Maybe your 530S
was of a different vintage than mine. My manual does NOT show a
transverter output. Have you got any more suggestions? Based upon
your suggestion to use the output of the 12BY7A I have the following
question. How much load can I place on this point? The spec for the
transverter says it is a 50 ohm input. I doubt I can load the DRV
line with a 50 ohm load. Any thoughts?
We have taken up enough bandwidth on the net with this one. Please
email me directly if you have any lengthy thoughts. I will post the
results once I get the interface worked out if the interest is there.
73 for now. de WB1FLD email bourque@sceng.ub.com

I still remember the terror I experienced the day I sent out
my first CQ on CW (was actually my first contact of any kind)
and somebody answered! I was totally unprepared for a response,
having practiced sending CQ on the oscillator for some time
before the fateful afternoon. I finally did make contact but
to this day I'm not 100% sure who it was other than someone
in Chicago! My hands were shaking throughout the QSO!

> I want to sound like a "professional amateur". I don't want to
> get a reputation for being a "lid" early on! But comments like
> yours aren't entirely encouraging. I'm not sure if ham radio is a
> welcoming hobby, or a closed clique.

I wasn't sure either at first, but I soon found out that the hobby is
about as clique-ish as one's self. In other words, if you're able to
strike up conversations with total strangers, say, in the grocery store,
then chances are you'll have no problem on ham radio. I didn't have
this newsgroup when I first got started, and didn't know a single soul
in the local ham radio community. I had been listening to 2 meters on
a portable scanner and had been wondering how I would "fit in" once I
got my license.... Yes, I was diving into this alone, frightened, and
without an experienced trail guide :-).

> I've read lots of the books and magazines. I still have LOTS of

> tech".

Well, guess what... there are thousands of codeless tech's out there already. _They_ would have been happy to talk to you. Around here, N7xxx once meant codeless, but not anymore. There aren't any N7's left.... The "resentment" factor is of no consequence. There will always be those who disapproved of the nocode thing, but they probably weren't very friendly before nocode either. Don't worry, most hams could care less about nocode.

> Ok, maybe I'm oversensitive. But code and theory is easy,
> avoiding gaffs on the air appears to be difficult. By December, I
> may be the only "advanced" class ham with less than 20 QSOs under
> his belt!

You won't be the first. I think I had about as many when I got my advanced. It's a case of "Let he who is without sin cast the first stone". If anyone can show me a ham who hasn't made on-air gaffs, then I'll show you someone who just received their license in the mail. It's just a fact of life, once in a while you'll get egg on your face, in public and over the airwaves. It's those who can bounce back without skipping a beat who have the most fun and stay in for the long run. If you can laugh at yourself, others will see themselves in your shoes.

> Here are some questions:
>
> 1) Everybody on 2m seems to know each other already. How do I get
> involved?

You listen. When you hear something that you are familiar with, or when you have a question, or when you have an answer, pipe in by dropping your call sign. Ham radio is a hobby of talkers, and conversationalists. If by chance the group you break in on is unfriendly, politely thank them and move on. On the other hand, you'll probably be integrated right into the round table as if you had been there for years.

It's very important to be there every day. If there is a particular group who talks about things that interest you, be sure and show up regularly on frequency. You'll soon become a part of the regular group if they know you're there.

> 2) There seem to be MANY repeaters in my area. If I use them, I
> should support them, right? but I can't pay dues to ALL those
> clubs. Are regular vistors welcome on open repeaters? How
> does this work?

Its nice when you help support them but it isn't always necessary. Some repeater owners expect no contributions whatsoever and are quite happy with that arrangement. Accepting no contributions has its benefits,

which is mainly the absolute authority over the machine. No user dues means that you don't have to listen to user complaints and that you can institute any policies that you feel fit to establish.

Other repeater groups actively solicit donations and dues, and you can be sure that they'll make this known. If you use their service then you should contribute. If your use is very occasional to not-at-all, then don't feel obligated to donate. It's not uncommon to "donate" to the cause and not realize that the "cause" might be the repeater owner's new TS-950SDX or FT-1000D :-)

> 3) Based on what I read, apart from real emergencies, there
> appears to be no valid use for an autopatch. True?

False. "Valid" in this context equates to "desired". If you want to make a personal, non business local call, then it's as valid as any other QSO. Emergency traffic does of course, take priority at all times.

> 4) Apart from the fact that I'd be unwisely broadcasting my
> creditcard number, is there a reason why a long-distance credit
> card call is inappropriate for autopatch?

No. There's nothing wrong with it. You're radio transmission is considered 'local' in this case. We have repeaters in our area on which regular ragchewing is discouraged and phone calls take precedence. It's kind of like the clubhouse telephone, which sits in the corner for everyone to use. The 2 minute autopatch timer keeps calls short and to the point.

> Does a long distance call violate the business use rule, as its
> furthering the business of Sprint or MCI?

No. The business rule has to do with conducting business as a part of the message(s) transmitted, not the medium over which they were relayed.

The real danger here is that you're spending more time worrying about rules and procedure than you are operating. You've already passed the written test, you'll get the subtleties as you go along. By and large, there are no FCC Police squads out there, just a number of self appointed repeater cops and armchair lawyers who lay in wait for some poor soul to ambush with their righteous interpretations of the law. Don't listen to these guys and don't become one yourself.

> 5) I've heard a local "net" on 10m. I mean REALLY local, all

3363. Novice Class Question

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-30 16:44:51 UTC
From: rhatch@sdsu.edu
Message-ID: <rhatch.9@sdsu.edu>
Source record: 284641

I was once a ham back in the olden days before transistors (mid '50s). I was KN9GNP and later K9GNP (Technician Class) in the late '50s. At that time, as I understood it, you could only be a Novice once, ever, for life. Is that rule still in effect, or is it possible for me to become a Novice again?

I've pretty much forgotten the code, and the electronics has pretty much changed since then, so I imagine I'd be starting pretty close to zero, and Novice Class might be appropriate.

This seems like a somewhat specialized question that might not be in an FAQ file--sorry if it is.

Dick Hatch
San Diego State University

Incidentally, I once found a real-life use for Morse code. I got stuck in an elevator on campus in a parking structure on a vacation day, and I amused myself by sending many personal comments about the manufacturer (and his mother) on the emergency bell in Morse code while I was waiting for someone to notice and call the emergency crew. The guy who showed up to get me out and fix the elevator, a former ham, was quite amused.

>it doesn't look good next to other Collins equipment.

It is nearly impossible to get a good paint job using a "paint bomb". If you want to get the original finish, you will have to find someone who knows how to properly prepare the chassis, and how to correctly use a good quality spray gun (who knows, it may even be you? :-). OBTW, the paint on the Collin's S-line gear was never glossy. If yours seems glossy to you, it might be that you have a different opinion of what glossy is, or barring that, repainted gear. (glossy is what is supposed to come on new cars) The "satin" finish that you got is probably due to "overspray" from the "paint bomb". It is a classic problem with spray paint cans, and there is nothing you can do to prevent it.

The paint in the "paint bomb" that you got from SSN is the correct paint. If you want to get the paint for use in a spray gun, it can be ordered from the company that originally provided the paint to Collins. The company is named Klinger Paint Company of Cedar Rapids (319)366-7735. The paint number for the front ring is #126, the front panel is #250, and the case is #180. Klinger has a minimum order of 1 gallon for each color, and the price is ~$100 per gallon!

I am told that a suitable replacement paint can be mixed by Pittsburg Paints. the info is:
Trim ring: 20-110 B10 C12 (white and pastel mixing base)

Cabinet: 20-150 B34 C12 (midtone mixing base)

for extra shine (more than the Collins ever had!) mix
54-150 in equal proportions with the base.

This paint is labeled "house paint", and is priced more reasonably. These paint formulas come from the "The Collins Collector's" magazine. As I understand it, the Pittsburg paint formulas are used by a lot of restorers.

73,

Chuck Harris - WA3UQV

> yours aren't entirely encouraging. I'm not sure if ham radio is a
> welcoming hobby, or a closed clique.

Usually a simple, "I'm new at this" will suffice. We were all new at it at one time, and most of us remember fondly those old-timers who helped us out. Those few who look down on newcomers aren't worth worrying about. No one was born knowing all about ham radio.

> I've read lots of the books and magazines. I still have LOTS of
> questions. I'm aware of a resentment among some hams toward
> codeless techs, so I started with Novice, so I could avoid getting
> a "N1xxx" call. In my area, that means "probably a codeless
> tech".

Whether or not you know the code isn't the measure of your "amateurness." I know codeless Techs who, in their short time in ham radio, have contributed a great deal to the amateur service. Similarly, I know folks with 1x2 calls and 40-wpm skills who have contributed nothing, ever. I'm glad you learned the code; it can be a lot of fun. But people shouldn't--and I hope *you* won't--look down on codeless Techs. Anyone who does so is not a real ham in my book.

> 1) Everybody on 2m seems to know each other already. How do I get
> involved?

Again, let folks *know* you're new at it. Ask who sponsors the repeater you're using, and let them know how much you appreciate the service the repeater provides and all of the hard work they put in to keep it running. (Flattery *will* get you somewhere, particularly if it's sincere.) Ask what local clubs are in the area. (You can also get a list of local clubs from ARRL by emailing lhurder@arrl.org.) The local club is a good place to make contact with the amateurs in your area.

Often, there are club-sponsored activities that you'll enjoy.

> 2) There seem to be MANY repeaters in my area. If I use them, I
> should support them, right? but I can't pay dues to ALL those
> clubs. Are regular vistors welcome on open repeaters? How
> does this work?

Different repeater operators/organizations have different views on this. It probably varies in dirrerent regions of the country, too. I think the most common view is that you should support at least *one* repeater if you use repeaters. Usually, this will be the one sponsored by your local club, or the one you consider your "home" repeater. Avoid monopolizing any repeater, whether you support it or not, and you'll seldom have a problem.

> 3) Based on what I read, apart from real emergencies, there
> appears to be no valid use for an autopatch. True?

What's valid? My personal rules for judging the validity of amateur activities are: will the activity seriously impede others from doing *their* activities, or is it a danger to the amateur service itself (e.g., using amateur frequencies as a replacement for commercial ones). I don't see that autopatching per se represents a problem on either of these points. But, like eating red meat, it's best done in moderation if at all.

> 4) Apart from the fact that I'd be unwisely broadcasting my
> creditcard number, is there a reason why a long-distance credit
> card call is inappropriate for autopatch?

No, but that would be reason enough for me!

> Does a long distance call violate the business use rule, as its
> furthering the business of Sprint or MCI?

I suppose one could argue so, but I think it would be a stretch. You could equally argue that the repeater furthers the business of the local power company because of the power it consumes.

> 5) I've heard a local "net" on 10m. I mean REALLY local, all
> within a 25 mile radius of me. They get on and exchange 1010
> numbers and their own "net numbers", and talk about basically
> nothing. If I could join them some night, I'd DOUBLE my
> contacts to date !
>
> How do I do this? Would I be welcome if I just dropped my call
> in during a lull?

Try it! Chances are you would be welcome. In every net I've ever participated in, "joiners" were welcome. I'd say it's the rule rather than the exception.

3367. How to balance a tuna?

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-30 17:31:00 UTC
From: kevin@cyber.net
Message-ID: <2977@news.cerf.net>
Source record: 284646

I am thinking about building the VersaLoop antenna, which appeared in the August 1989 (I think) issue of QST. I'm currently using an inverted vee for 40 meters, and want something that will do better on 20 meters than the 'vee. If you are unfamiliar with the versaloop, it is essentially two intersecting, perpendicular loops, only one of which is attached to the feedline at any given time. The feedpoint is in the middle of the bottom leg of the loop, and the top of the loop may be open or closed. The loop to be used, and whether it is to be open or closed, are each selected via a relay.

I would like to feed the antenna with twin-lead, but I only have an inexpensive MFJ antenna tuna. It does have a balun in it, but in an editor's note in the article it was mentioned that using a balun would achieve less than satisfactory results. The editor recommended using a balanced tuna instead.

A couple of questions: first, has anyone an opinion of this antenna's practical performance, and second, what is the compromise being made if I just use my tuner as-is as compared with getting a balanced tuner? It seems to me there will be less RF in my shack if I use a balun, since that should keep the current off the outside of the interconnecting coax between rig and tuner. Could someone please clarify the difference between balanced and unbalanced antenna tuners and what the practical considerations of each would be, i.e., efficiency, and potential RFI.

Thanks in advance for any help.

> [I'm a new ham, and I haven't made many contacts ...]

> The reason is that I am scared to death.

> I want to sound like a "professional amateur".

Don't even try to sound like a "professional amateur." Just
be yourself. Don't use a lot of lingo, Q-signals, and other
stuff that has little or no purpose on phone. For example,
avoid:

I'm getting a lot of QRM, old man, so we'd better QSB.
Well, I am running mobile and I'm destinated at my home QTH
now, so we'd better say seventy-threes.

A lot of lingo is actually used improperly. In the above example,
it is difficult over the radio to tell if he was saying
"QRM" (interference from other stations) or "QRN" (atmospheric noise).
"Seventy-threes" is completely wrong, as "seven three" means
"best regards" and is already plural. ("Seventy threes" would therefore
mean "best regards-es") "Destinated" is not a word in the
English language. "Old man" makes no sense, especially if you're
talking to a woman.

Instead, just be natural:

There's a lot of interference on this frequency, would you
like to change frequencies? Well, I'm mobile, and I'm
pulling into the driveway on my house, so I will need
to turn off the radio. I hope to speak with you again.

When in doubt, use plain English. Maybe a few hams out there
will recognize that you are not a "professional amateur",
but to heck with them. If hams only used plain English more,
we wouldn't seem like such a "closed clique."

> I'm not sure if ham radio is a
> welcoming hobby, or a closed clique.

> I've read lots of the books and magazines. I still have LOTS of
> questions. I'm aware of a resentment among some hams toward
> codeless techs, so I started with Novice, so I could avoid getting
> a "N1xxx" call. In my area, that means "probably a codeless
> tech".

There are a few vocal hams who are offended at the idea of
people who get on the air without knowing code. To heck with
them. Don't let the few bad eggs bother you. The vast

majority of hams are friendly.

> Here are some questions:

> 1) Everybody on 2m seems to know each other already. How do I get
> involved?

I just get on a repeater and say, "KK6MY monitoring." Usually
someone responds, a start talking to him, and more often than
not, I've made a new friend. If you find a repeater that
seems to be a "closed clique", just get on another repeater.

> 2) There seem to be MANY repeaters in my area. If I use them, I
> should support them, right? but I can't pay dues to ALL those
> clubs. Are regular vistors welcome on open repeaters? How
> does this work?

You are not obligated to financially support repeaters. If you
use one frequently, it is courtesy to contribute a few bucks
toward its operation. Generally, financial things are not
discussed over the air, so once you get to know someone personally
on the repeater, you may want to give him a phone call
and ask about this issue. Always feel free to use
any open repeater.

> 3) Based on what I read, apart from real emergencies, there
> appears to be no valid use for an autopatch. True?

It depends on what you call "valid". If I am stuck in traffic, and
my wife is worried about me, it is nice for me to be able
to call her via autopatch. Autopatch outside of emergencies
is a convenience, not a necessity, but it can be a darn nice
convenience.

> 4) Apart from the fact that I'd be unwisely broadcasting my
> creditcard number, is there a reason why a long-distance credit
> card call is inappropriate for autopatch?

The problem is that the organization running the autopatch
needs to pay for the call. Other than that, there is
no reason why long-distance calls are inherently "inappropriate".

> Does a long distance call violate the business use rule, as its
> furthering the business of Sprint or MCI?

No. We have gone around and around on the net about what constitutes
"business" communication through autopatch. Rumor has it that the FCC
will be loosening up rules on this.

> 5) I've heard a local "net" on 10m. I mean REALLY local, all
> within a 25 mile radius of me. They get on and exchange 1010

Indeed! Letters to the editor of QST in the 40's, 50's and on have the same story. Poor operating practices have been with us, are with us now and unfortunately will stay with us. After all, was not the dreaded Wouff Hong invented to deal with recalcitrant bad operators? If you read the letters from way back you will be surprised how current the points they raise seem to be. That is not to say that we should not try to educate novices about better practices. It might be much worse otherwise. :(

There are only four repeater pairs, and you have found all of
them. 29.600 is the most popular calling/simplex frequency.
I don't know much about the OSCAR subband.

>I'm also curious if Novice/Tech plus hams can operate FM from
>28.3 to 28.5. It seems they have voice privledges here but
>I don't see where it specifies mode. Since narrow band FM is
>allowed to 28.3 can N/T operate FM here?

Novices cannot use FM at all. Techs can use FM only
on 6m and above. You must have at least a General class ticket
to operate FM on 10m.

I really enjoy FM on 10m and wish that it were used more often.

Source record: 284653

The only way to get something special is to have Congress pass a
law to provide for adequate funding of the FCC. They do not have
the staff nor the proper computer system to reissue expired calls,
club calls or issue special calls. If they make some exceptions, that is
by keeping manual records on file cards, they would be flooded with
requests that they can't handle.
In summary, I'd say the possibility to do what you want is
nill. Also, no need to worry about someone getting the old call since
for the same reasons the can't reisssue it either.

WHAT: EDUCATIONAL WORKSHOP -- "Uses of Amateur Radio & Satellites
in Education"

WHO: School Teachers, Amateur Radio Recruiters,
Volunteer Evening Instructors

WHEN: Friday October 9, 1992 from 12 Noon to 5 PM

WHERE: Intelsat, 3400 International Dr NW, Washington DC

Speakers will give 20-minute presentations on such topics as using
satellites to teach physics, geography, computers; ways to use
satellites in grades kindergarten through college; and recruiting
people to our hobby through the use of satellites.

A 'roundtable' discussion will also take place.

** If you attend the full 5 hours, you'll earn .5 Continuing Education
Units, sometimes required by employers as part of your job. The
book, Proceedings of the AMSAT-NA Symposium, will contain workshop
speakers' presentations and papers from the AMSAT symposium. **

WORKSHOP SCHEDULE

FRIDAY OCTOBER 9, 1992
12 00 - TBA - Doug Loughmiller, KO5I
12 30 - TBA - Frank Bauer, KA3HDO (SAREX Working Group)
01 00 - TBA- Rosalie White, WA1STO (ARRL Educational Activities)
01 30 "Satellites at Weber State University" Robert Twiggs
02 00 "Using Weather Satellite Imagery as
an Educational Tool" Jeff Wallach, N5ITU
02 30 "Satellite experiments
at the US Naval Academy" Bob Bruninga, WB4APR

3 to 3:20 'ROUNDTABLE' DISCUSSION

03 30 "Satellites for Understanding
Space Experiments" Joe Kasser, G3ZCZ
04 00 "SAREX Goes to College" Dr. Paul Shuch, N6TX
04 30 "Amateur Satellites in the High School Curriculum"
Ben Acton, KC3QP; Paul Skellchock; and Dan Jayjock

See you there!

>-Ron
This is not true. The FCC made at least one pass back through the W's
and K's before they issued the WA's. My call is reissued and, as a
barely teen age ham I was confronted on the air (on 75 meters) by
someone who knew that the former holder of my call was a silent key (or
silent D104) and was sure I was a bootlegger. At the time I was first
licensed (1959), you could not request a call--that came somewhat later
with "incentive" licensing.

I just stuck it in my wallet. Nobody ever wants to see it (unless I upgrade which I'm done doing) and it's not difficult to replace if it gets lost or damage (as a matter of fact, it's much less tramatic than losing the other stuff in my wallet like my drivers license and credit cards).

3383. ONE MORE BNC/N CONNECTOR QUESTION...

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-30 19:45:50 UTC

Source record: 284662

I need to make up a 4 foot cable with a N connector on one end and a BNC on the other. Is such thing possible?

1) Is there a BNC connector that will fit RG/8 (including 9913) size cable?

2) Is there a N connector that will fit RG/58 (or 59) size cable?

Are these connectors commonly available? Would places like AES or HRO carry them?

Are they reasonable price? $3-4 range?

Or, am I just better off using BNC -> N and N -> BNC adapters?

3387. FCC and Special License Requests

Newsgroup: rec.radio.amateur.misc
Date: 1992-09-30 21:26:00 UTC
From: RON@NSULA.EDU
Message-ID: <920930162508.5062@NSULA.EDU>
Source record: 284578

I've seen several postings recently in response to questions about requests for special calls, etc. In these responses just about everyone makes reference to an inadequate computer system as being one of the reasons for their inability to do this.

This is CRAZY! A system that will not allow them to edit records! What do they do when you send in a 610 form to change your address???? Build a new record and delete the old one?!

If their system is this old and inadequate I would be more than happy (for a nominal fee and 1x2 call sign) to rewrite this for them.

I can understand a lack of manpower to process the request but I think blaming the computer is a poor execuse. If they're worried about tracking changes....Add a field on each record for previous callsign. Any programmer worth his salary should be able to handle this one.

[My 2 Cents!!!]

|>I need to make up a 4 foot cable with a N connector on one end and a BNC on
|>the other. Is such thing possible?

No problem. You can buy them from any number of cable/connector suppliers, though they tend to charge a premium for doing the work for you.

|>1) Is there a BNC connector that will fit RG/8 (including 9913) size cable?

RG/8, you bet. 9913, I don't know. (9913 seems to be one of those odd sized cables for which few connectors exist.)

|>2) Is there a N connector that will fit RG/58 (or 59) size cable?

RG58, yes. RG59, maybe, though that would be silly since N connectors are 50 ohms and RG59 is 75. (There exist special 75-ohm BNC connectors, by the way, though often people put 50 ohm ones onto RG59. Some high end video monitor cables come with real 75 ohm BNCs -- for example the ones on my DEC VRT19. As another aside, 50-ohm BNCs designed to fit RG59 are sometimes sold by unscrupulous or ignorant dealers as "RG/8x BNCs". They aren't, and won't fit, though careful drilling and some luck can convert them into ones that do fit...)

|>Are these connectors commonly available? Would places like AES or HRO
|>carry them?

I've never tried, but I wouldn't be too optimistic. Digi-key might have them, though. Certainly the major connector makers have them, and you may be able to work with the local distributer.

|>Are they reasonable price? $3-4 range?

It's hard to imagine any good N connector being that low, let alone an odd one. But I may be pessimistic, or you may be luckier...

|>Or, am I just better off using BNC -> N and N -> BNC adapters?

Depends. I have a supply of UHF to BNC patch cords so I don't need so many adapters. For places where I know I want to go from X to Y, the patch cord is handy. Adapters then serve for the exception cases. Part of the reason is that they are another piece of hardware to deal with, and I just like the reduced clutter from not having so many adapters. This seems to be basically a taste question, though, at least below microwave frequencies.

>a call except by request (back when they were willing to take those requests).

The FCC did for a while recycle callsigns. Got my license back in '76,
and my call was recycled. Once found the orginal holder in an old callbook,
he got it sometime in the late 50s- early 60s. I think the FCC did this
for only a year or two back then. I didn't mind a recycled call, I like
having a "W" callsign. Get to say "Whiskey ...." :-) Also a vague
connection to the broadcast stations here in the east people get when
I tell non-hams my call.

>--

Congratulations!

You should have received the new version of license which consists of a larger form, suitable for framing, and a smaller, wallet sized license, suitable for wallet-carrying. Both forms are equivalent and interchangable (ie both legal proof of license.) If you wanna carry the wallet sized original, you would still have another original license at home on the wall. As far as what most hams do, there probably isn't a majority practice, and besides, its really up to what you feel like doing.

Welcome to Ham radio...

and good luck...

rhatch@sdsu.edu (Richard Hatch) writes:

>I was once a ham back in the olden days before transistors (mid '50s). I
>was KN9GNP and later K9GNP (Technician Class) in the late '50s. At that
>time, as I understood it, you could only be a Novice once, ever, for life.
>Is that rule still in effect, or is it possible for me to become a Novice
>again?

>I've pretty much forgotten the code, and the electronics has pretty much
>changed since then, so I imagine I'd be starting pretty close to zero, and
>Novice Class might be appropriate.

Welcome back to ham radio!

Today, the Novice class ticket, like all other classes of
ham licenses, is valid for 10 years and is renewable. Novices
have small sections of the 80m, 40m, 15m, and 10m band
for CW, and may also operate SSB phone on 10m from 28.3 to
28.5 MHz. VFOs are permitted now also.

You may become a Novice again. I would suggest dropping
by Radio Shack and picking up the Novice Class License course
that they offer. (It's in a small blue binder with cassettes)
You should be able to pick up the code again with no problem.

You will take the test from a Volunteer Examiner (VE) in or
near your community. The FCC no longer gives tests. The Radio
Shack book will tell you about how to take the test.

QSB wan't used correctly above either. Maybe you were thinking QSY or
QRT and typed QSB instead.

|> I just get on a repeater and say, "KK6MY monitoring." Usually

KK6MY listening works well too. This seems to be a repearter/local
standard, but isn't really very important.

|> > 2) There seem to be MANY repeaters in my area. If I use them, I

|> discussed over the air, so once you get to know someone personally
|> on the repeater, you may want to give him a phone call
|> and ask about this issue. Always feel free to use
|> any open repeater.

Open machines are more common on some bands than others, but you
can almost always find one on each band. It just seems that some 440MHz
and a few 144MHz machines were put up as private intercoms for two or
three users. This isn't the rule by anymeans, but more common on
440MHz for some reason. 220MHz and 1280MHz machines tend to be open
and friendly around here. On some "closed" machines you may not be
welcomed with open arms, but don't let them run you off too easily.

Repeater owners don't own the frequency, so they can't really kick you
off the frequency. If they don't want you to use their machine fine,
they can turn it off. I'm not telling you to get on the machine and
jaw dawn to dusk. Just don't let someone tell you that they own the
frequency. Read the back of your ticket, opps I mean your license,
that fact is stated in clear black and white. Don't abuse this fact
it will only make you very unpopular. Just don't take any crap or
cheapshots from people who don't even know you.

|>
|> > 3) Based on what I read, apart from real emergencies, there

|> is a convenience, not a necessity, but it can be a darn nice
|> convenience.

We use our patch for whatever we want. If it isn't business and you
don't mind everyone listening in use the patch. None of us feel any
need to use a corner pay phone to call a friend before dropping in.

We don't feel we owe Ma Bell the business. Other people may not agree
with this, but we don't owe anyone our business. MCI and Sprint have
proven that Ma Bell doesn't own our personal communications rights. This
whole thing seems to be based on the old idea of protecting Ma Bell from
any form of competition. European countries still have this problem, but
not here. We don't order food from Dominos, but I wouldn't really get
upset if someone did. Just as long as they don't own the Dominos or
are a Dominos delivery driver, now that would be business I my book.

|> The problem is that the organization running the autopatch
|> needs to pay for the call. Other than that, there is

|>
|> No. We have gone around and around on the net about what constitutes
|> "business" communication through autopatch. Rumor has it that the FCC
|> will be loosening up rules on this.

Maybe sometime I will tell you all about the time a ham friend of mine
used ours to call the Keremlin (sp?) as a demo one night. It worked fine.
Everyone around at the time, mainly non-hams, will remember it for a while.
People who were there still bring it up when one of use shows up with an HT.

Just remember it is a hobby and have fun.

3396. Amateurs on USENET List Oct 1992 Part 1 of 3

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-01 01:06:21 UTC
From: mark@ve6mgs.ampr.org
Message-ID: <1992Oct1.010621.23743@ve6mgs.ampr.org>
Source record: 284592

I would be pleased to take any e-mail updates to this list. I have split this
list into three parts now. This first part contains primarily European calls
with US call districts 1, 2 and 3.

Enjoy, 73 de VE6MGS/Mark -sk-

3397. Ham Show on commecial satillite ? Need Schedule ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-01 01:32:23 UTC
From: cal@admiral.uucp
Message-ID: <ogZXRB1w164w@admiral.uucp>
Source record: 284599

I'm looking for the schedule of all and any of the amateur radio
shows aried on commercial satillite along with the bird and
transponder. The effort will be greatly appreciated.

Thanks & 73, Cal - N1HAL

3398. Re: Feedback to Operating Practices

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-01 01:32:45 UTC
From: larson@loren.net.com
Message-ID: <1992Oct1.013245.29020@unet.net.com>
Source record: 284582

In article <1992Sep29.200126.16371@convex.com> tonyp@convex.com
quotes the comments of someone who wrote him.

> For equipment, I have an HF transceiver, and a borrowed 2m HT. I
> have spent LOTS of time listening, and very little attempting to
> make contacts. My log shows exactly 10 contacts (9 10m SSB, 1 10m
> CW). I haven't spoken to anyone on the HT.

Not a bad thing. Listening is good. You can learn a lot that way.
The only thing you have to do is learn to recognize what is done well
and what is being done poorly.

Don't let anyone tell you that you are wasting your time by not
getting on and transmitting more.

> The reason is that I am scared to death.

Well, I must admit that this is not the best reason to listen.

> I want to sound like a "professional amateur". I don't want to
> get a reputation for being a "lid" early on! But comments like
> yours aren't entirely encouraging. I'm not sure if ham radio is a
> welcoming hobby, or a closed clique.

Well, amateurs, and amateur groups, vary in how open they tend to be.

Your desire to sound "professional" is commendable. Even so, we
all make mistakes, and the world hasn't ended yet as a result.

> Ok, maybe I'm oversensitive. But code and theory is easy,
> avoiding gaffs on the air appears to be difficult. By December, I
> may be the only "advanced" class ham with less than 20 QSOs under
> his belt!

Don't worry about that. I believe a friend of mine had an Amateur Extra
with far less on the air QSOs than that. He was somewhere in the range of
none at all, but he may have had one or two.

Alan

3399. Mac Morse Code

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-01 01:47:00 UTC
From: st1pb@rosie.uh.edu
Message-ID: <30SEP199220470657@rosie.uh.edu>
Source record: 284584

Does anybody know where I can get a decent Mac morse code
tutor program? I have FTP access.

I have seen Morse.sit and MacMorse.sit.hqx and they were
pretty poor.

Dean - KB5USC

3400. ICOM-2SRA: 2m and Scanner: How is it?

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-01 01:57:40 UTC
From: jclarke@teal.csn.org
Message-ID: <jclarke.717904660@teal>
Source record: 284585
Cross-posted to: alt.radio.scanner,rec.radio.amateur.misc

I am currently in the market for both a full range scanner and
a new 2m HT. In this months QST, there was a review of the availble 2m
radios. Among them is the ICOM-2SRA, which got good review. I seem to
the exact person that the unit was designed for. I am looking for any
comments users have with this unit, both as a HT and a scanner. For
example, would it make more sense to buy a KENWOOD TH-28A and RADIO
SHACK Pro 38 (?), there 200 channel desk unit. Does the '2-SRA have
a seek mode? How fast is the scanning of programmed channels? Any insight
that someone may have, both the amateur world and the scanner world would
be appreciated.

Thanks,

J. Christopher Clarke

3401. Amateurs on USENET List Oct 1992 2 of 3

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-01 02:07:16 UTC
From: mark@ve6mgs.ampr.org
Message-ID: <1992Oct1.020716.24687@ve6mgs.ampr.org>
Source record: 284594

I would be pleased to take any e-mail updates to this list. I have split this list into three parts. This second part contains primarily US call districts 4, 5 and 6.

Enjoy, 73 de VE6MGS/Mark -sk-

```
# Network address to name or call letters lookup table
# archived for ftp @ ftp.cs.buffalo.edu:hams_on_usenet courtesy of
# Devon Bowen KA2NRC bowen@cs.buffalo.edu as suggested by Paul Schleck
# Please send corrections/deletions/additions to mark@ve6mgs.ampr.org,
# mark@ve6mgs.ampr.ab.ca or ...!adec23!mark (depending on how the ball
# bounces :-)
#
# Last update Sep 30 1992
#
# This document may be distributed freely, as long as there is no financial
# gain. I do not condone this list being used for generating junk mail or
# other annoyances as this is not the purpose of the list. If you are in this
# list and wish to keep your entry hidden, I would oblige.
#
# Entries have this format (-> denotes separated by at least one tab):
# Address (Name) -> Call -> Date
#
# Address
# Network address popularily used by individuals on the network. Although
# the address that many news posters add may be incorrect, personal
# e-mail contacts or updates are always placed first in the list of
# duplicate calls. Removal of entries is by complaint only, so some
# (mainly .EDU) may be invalid over time. Some GENIE Hams are included
# (Generated by Brian Murrey/KB9BVN) in this list, their addresses are
# listed as ??@<GEnie> which of course is unaddressable. Mike Shirley
# WB6WUI mikey@slic.cts.com is willing to relay manually to GENIE.
# The same goes for fidonet addresses ??@<Fido), but without a
# gateway contact person ...
#
# Name Name of the individual.
# Call Call letters of the individual.
# Date Last update YY-MM[-DD] International format.
# A trailing * denotes not searched in call book for verification yet, @
# means not found in call book (1987 or 1991 US). ? after means recheck may be
# required (eg. Call does not match name).
#

3402. Amateurs on USENET List Oct 1992 Part 3 of 3

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-01 02:25:32 UTC
From: mark@ve6mgs.ampr.org
Message-ID: <1992Oct1.022532.24949@ve6mgs.ampr.org>
Source record: 284593

I would be pleased to take any e-mail updates to this list. I have split this
list into three parts. This third part contains whatever is left over ...

Enjoy, 73 de VE6MGS/Mark -sk-

```
# Network address to name or call letters lookup table
# archived for ftp @ ftp.cs.buffalo.edu:hams_on_usenet courtesy of
# Devon Bowen KA2NRC bowen@cs.buffalo.edu as suggested by Paul Schleck
# Please send corrections/deletions/additions to mark@ve6mgs.ampr.org,
# mark@ve6mgs.ampr.ab.ca or ...!adec23!mark (depending on how the ball
# bounces :-)
#
# Last update Sep 30 1992
#
# This document may be distributed freely, as long as there is no financial
# gain. I do not condone this list being used for generating junk mail or
# other annoyances as this is not the purpose of the list. If you are in this
# list and wish to keep your entry hidden, I would oblige.
#
# Entries have this format (-> denotes separated by at least one tab):
# Address (Name) -> Call -> Date
#
# Address
# Network address popularily used by individuals on the network. Although
# the address that many news posters add may be incorrect, personal
# e-mail contacts or updates are always placed first in the list of
# duplicate calls. Removal of entries is by complaint only, so some
# (mainly .EDU) may be invalid over time. Some GENIE Hams are included
# (Generated by Brian Murrey/KB9BVN) in this list, their addresses are
# listed as ??@<GEnie> which of course is unaddressable. Mike Shirley
# WB6WUI mikey@slic.cts.com is willing to relay manually to GENIE.
# The same goes for fidonet addresses ??@<Fido), but without a
# gateway contact person ...
#
# Name Name of the individual.
# Call Call letters of the individual.
# Date Last update YY-MM[-DD] International format.
# A trailing * denotes not searched in call book for verification yet, @
# means not found in call book (1987 or 1991 US). ? after means recheck may be
# required (eg. Call does not match name).
#

3403. Consumer Reports tests light dimmers

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-01 03:13:22 UTC
From: wa2ise@cbnewsb.cb.att.com
Message-ID: <1992Oct1.031322.17623@cbfsb.cb.att.com>
Source record: 284586

Saw in the latest _Consumer Reports_ mag an article on light dimmers.
They tested them for various qualities, but they didn't check for RFI
generation or succeptability.

3404. FCC RadioTelephone Operator's License

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-01 03:14:28 UTC
From: der@anomaly.sbs.risc.net
Message-ID: <1992Oct01.031428.5944@anomaly.sbs.risc.net>
Source record: 284587

Since I've pretty much mastered amateur theory, I thought it might be fun to continue on and study for some of the other FCC licenses. What exactly does a RadioTelephone operator's license consist of (i.e. what type of privledges does it convey, what are the licensing requirements, etc.?

3405. Biannual Elmers List Purge/Reconfirmation

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-01 03:45:34 UTC
From: pschleck@cwis.unomaha.edu
Message-ID: <pschleck.717911134@cwis>
Source record: 284589

Approximately 1 week ago, I mailed the following to all Elmers on my
list at their last known E-mail addresses:

>Greetings fellow Usenet Elmer,
>
>In case you didn't know, the Elmers Resource Directory will be 2 years
>old this February. While the list's size and diversity that has
>developed during this period is commendable, it also brings with it the
>increased chance of inaccurate and out-of-date information. Therefore,
>I've decided to do a biannual (the first) reconfirmation/purge
>of the Elmers list. I will also be undertaking a recruiting drive for
>new Elmers (more on that in a future announcement).
>
>I've enclosed the latest copy of the Directory below. Please take the
>time to review your entry, confirm that it is correct, and make updates
>if necessary. Please also confirm the Index to make sure I've listed
>you under the right topics. Apologies if you have recently joined or
>sent updates, but I really feel the need to solicit an across-the-board
>"QSL" to insure that everything is correct and up to date. I promise I
>won't bother you again for another 2 years :-).
>
>I will also be posting a notice to the rec.radio.amateur.misc newsgroup
>on October 1st (and a second notice on November 1st) to compensate for
>bounced E-mail (and vacations, time away from the net, semester/
>fiscal-year distractions, etc., etc.).
>
>If I don't hear from you by December 1st, I will assume that your entry is
>obsolete and will delete it. I will, of course, be more than happy to
>reinstate it at any time upon receipt of updated information.
>
>I'd like to collectively thank all the Elmers for their volunteerism and
>enthusiasm in support of this project. The net appreciates your
>efforts.
>
>73, Paul W. Schleck, KD3FU
>
>elmers-request@unomaha.edu
>
>Maintainer, Amateur Radio Elmers Resource Directory
>

Much to my surprise, there were no bounced messages. Since then, I've
received confirmation from those Elmers I have noted below with a "Y."
Non-responding Elmers are noted with an "N." I'm posting this message
in case my E-mail didn't reach everyone.

3406. Elmers Wanted, Apply Within

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-01 03:51:25 UTC
From: pschleck@cwis.unomaha.edu
Message-ID: <pschleck.717911485@cwis>
Source record: 284588

As noted previously, the Amateur Radio Elmers Resource Directory will be 2 years old early next year. In order to maintain its value to the net, I have strived to keep it accurate and up-to-date and constantly seek out new Elmers to join the list.

Since there will most likely be several obsolete entries on the list to be deleted, I'd like to replace them with new, motivated, quality Elmers from the net. Areas of expertise that are most desirable for the list right now include:

Digital Signal Processing (DSP)
TCP/IP Packet Radio and Gateways/Internetworking
Amateur Satellites
Amateur-related Software for Unix/PC/Mac/Amiga

Although expertise in any other area would, of course, be welcome also.

I'd like to emphasize that participation is totally voluntary, with very minimal obligations (1 or 2 polite inquiries a month, if feedback from existing Elmers is any indication). If you find that it is too much work, you are welcome to bow out, no questions asked. In the 2 years I have managed the list, only 1 Elmer resigned (and only because he was going on sabbatical to write a book, with a promise to return afterwards).

I've also attempted to seek out people on the net who I think would be good Elmers. If you've received a personal E-mail invitation from me, I urge you to give it serious consideration. The net would appreciate your volunteerism.

73, Paul W. Schleck, KD3FU

In article <1992Sep29.200615.16645@convex.com> tonyp@convex.COM writes:
[and someone else wrote:]

> 1) Everybody on 2m seems to know each other already. How do I get
> involved?
>
>Well - I *KNOW* exactly how you feel on this one: I've found 2 meters to
>be about the most unfriendly place in ham radio - short of the gestapo
>nets on SSB. The only thing that seems to work is to meet people in
>person - we used to go out for breakfast on saturday once a month - and
>once people meet you in person the barriers seem to drop down. I don't
>know (and I'm sorry to say) of anyone that made friends on a repeater.

YOU DO NOW..... seriously, I've very definitely made friends on a
2m repeater. I also happen to agree with you that this isn't nearly
as common as it should be.

what I normally do when visiting an area is to just id on the repeater
(when there's not a QSO in progress, of course, unless I mean to join in).
folks hear a call they don't recognize and often welcome me to the area.
in fact, I get this a lot even while here in chicago (where I currently
exist) --- folks hear a 5 call in 9-land, assume I'm from out of town,
and want to welcome me to the area (this is usually when I'm on at hours
where I'm normally not on the air). another thing to do is, if you hear
someone ask a question (especially if it doesn't get answered) that you
can help with, hey, you probably make a friend right then and there if
you can help out. :-)

but, there are certainly both types out there. at one point, I was
back home in San Antonio (Texas) during the summer break from school,
and had made several friends on the repeater. one night, I heard a
couple of (so-called) hams talking about this guy from TAMU who it
seemed was going to use the repeater for the whole summer, and how he
(I) should go somewhere where he *WAS* welcome..... well, after that,
I moved off to another repeater, and the folks I'd met caught up with
me and asked about where I'd been --- when I told them, I got a flood
of responses from people telling me that I was their *PERSONAL* guest,
and to ignore the above jerks. in fact, I later found out that those
2 had become rather unpopular over that, and *THEY* were the ones who
ended up not being welcome on the repeater (I wasn't the only person
who'd heard their comments.....).

so the real jerks are out there, but (from what I've seen) they usually
don't do anything except make enemies. besides, anyone with an attitude
like that probably doesn't hold a valid license anyways...ignore them.

> What's this thing?
> It's called a MODEM.
> And what's this button for?
> Whatever you do, don't touc{{{7bh6xx!{@%%hxbd&$#)$% NO CARRIER

cute..... :-)

73s....I'm about to fall asleep at the keyboard after playing musical
time-zones.....

3409. Re: Origin of HAM

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-01 04:37:10 UTC
From: haynes@cats.ucsc.edu
Message-ID: <1adv9mINNlij@darkstar.UCSC.EDU>
Source record: 284591

I'm just reading a fairly recent book "The American Telegrapher" "A Social History 1860-1900" by Edwin Gabler, Rutgers University Press, 1988. He gives some operator slang of the period: "rush" or "salt" meaning to harass the receiving operator by sending too fast, "plug" or "ham" for an inferior operator, "freshman" for a novice operator, who had to undergo salting as an initiation ritual. He doesn't give an exact source for these terms, but the text suggests they were found in magazines published for telegraph operators of the period.

Also talks about friendships developed over the wire, and also disagreements and rudeness, leading in one case to two operators meeting at a town halfway between their posts to settle their differences by fistfight.

The telegraph companies expected operators to work whatever circuits they were needed on; but operators tended to claim certain circuits as their own and objected to working others. Thomas Edison as a young telegrapher in Boston worked a wire with Jerry Borst in New York. The two men agreed to change three letters of the alphabet, so that nobody else could copy the code they sent.

The N8EMR Ham bbs is online to serve the needs of the
amateur radio operators..

HOW TO ACCESS THE N8EMR HAM RADIO TELEPHONE BBS !!!

System Name: N8EMR
Phone: 614-895-2553
Login: hbbs
Modems: TB2500 PEP/V.32 support
Times: 24hrs
IP Address: 44.70.0.1
Amateur radio annonymous ftp access is available via the ohio
netrom/ip network. CMHIP is the Netrom node Id and is known
by most of the nodes in ohio. (its slow but it works)
This is only via the ohio packet network. This sytem
is not available via the "INTERNET".

To access the system via the dialup, at the login prompt type hbbs
(lower case only), you will then enter the BBS program. Follow the
directions from the bbs prompts.

I attempt to keep the latest and greatest HAM software on-line, and
encourage all to upload Here is some of software that is available
for downloading.

NEWHAM area. Pick the tools you need to become a ham
AMSAT news and satellite keplerian elements
KA9Q TCP/IP Software for various computers,
ARRL related files
Latest packet bbs programs and utilitys.
Modifications for HAM Rigs and Scanners
DX and contesting programs
Many Packet related programs
Scanner, shortwave and TVRO files and messages.
NASA NEWS..
Online Callsign lookup.

```
EMAIL CALLSIGN SERVER
US CALLS ONLY

For those who do not have telnet access to marvin or one of the other
Internet callsign servers here is an alternative.

N8EMR's Ham BBS, 614-895-2553 has an email server up and running.
The Server is based on Buckmasters Spring 92 database.

------------------------ INTERNET AND CIS USERS -------------------------------

Mail should be addressed to
callbook@n8emr.cmhnet.org

If you have a well behaved mailer or a well know return address
the reply path will be taken from your mail header. If you have
a strange reply path or non standard reply path. You can use the
option REPLY line to specify a return path.
On the Subject line include a list a call signs to lookup. If your
mailer doesnt generate a Subject line you can use the option CALL
to specify a list of callsigns. All other lines and info are ignored.

E.G.
# mail callbook@n8emr.cmhnet.org
REPLY user@site.domain (your reply path, ! or @ format.)
CALL n8emr w5rrr (list of calls, space seperated)
^D
#

-------------------------- PACKET RADIO ----------------------------------------

Mail should be sent to CBOOK@N8JYV.#CMH.OH.USA.NA
You MUST use both the REPLY and CALL option lines.
The REPLY line should be as follows n8jyv!HOME_BBS!CALL, where
HOME_BBS is your local packet bbs where you would normal pick up
your mail, CALL is your callsign.
You must include the n8jyv! in your reply path.. Packet mail will fail
without this.

E.g.
SP CBOOK@N8JYV.#CMH.OH.USA.NA
Subject ^M
REPLY n8jyv!w8cqk!n8emr
CALL n8emr w1aw
/EX
```

------------------------------ FIDONET USERS ---------------------------------

Fidonet users can send request to call book 1:226/20.0

Mail sent to the fidonet address must have the following info
included the REPLY line in the following format.

REPLY fistname.lastname@fxx.nxx.zxx.fidonet.org

where xx is your fidonet node info.

---------------------------- OPTIONAL COMMANDS ---------------------------------

REPLY This is an email address you would like to send the lookup info
to. Either Internet @ or ! addressing is fine.
CALL This is a white space separated list of callsigns you would like
to lookup.

3412. Re: ICOM-2SRA: 2m and Scanner: How is it?

I wipped up this little review a while back; hope this helps.

IC-2SRA Review - Jason White (N0RWU)

The 2SRA combines a 2m HT (140-150 Tx, 138-174 Rx) on one "side" and a 25-950 MHz continuous coverage receiver on the other. The unit looks a lot like the W2A, except for the extra antenna. The 2m antenna uses a standard BNC connector, but the scanner antenna uses a 1/8" mono plug to connect to the unit. I have found this antenna to be inadequate for the serious scanner enthusiast.

Unfortunately, the non-BNC plug makes finding a replacement antenna impossible. To get around this problem, I hacked together an 1/8" male to BNC female adapter. I've located a mail-order electronics place that sells these adapters; mail me for more information. This allowed be to connect any BNC male type jack to the scanner side. While this works, the antenna is quite flimsy and care must be taken to keep the antenna from falling off. This isn't a problem unless you have the unit under your coat or something similar where the antenna may rub against your coat and come loose. I lost the replacement antenna I bought, plus the adapter I made when the antenna rubbed against my coat and fell off. To fix this problem, I attached a piece of wire to the antenna and connected it to the screw that the wrist strap goes around. With a replacement scanner antenna installed, I feel the reception is better than the PRO-34 I owned. The unit is very sensitive and, consequently, does suffer from intermod. For me, this does not present a real problem. I only have an occasional problem with one frequency out of 50.

The ham side of the unit has 30 channels, one call channel, and two channels that are used to program upper and lower scan limits for a total of 33 channels. The scanner side has 60 channels, one call channel, and two channels to program upper and lower scan limits for a total of 66 channels. The unit scans at about 10 channels/sec on the scanner side and about 6 or 7 channels/

sec on the ham side. The scanner side has FM, AM, & WFM modes as well as selective scanning modes, lockout, priority, and delay functions. It also has a full DTMF keypad (including A-D) and four 15-digit DTMF memories.

Each side of the unit has its own volume and squelch knobs. The unit supports pager and code squelch functions and with the tone squelch unit (included in the American version) also allows pocket beep and tone squelch functions. You can program one personal code and up to 5 group codes.

The LCD display is quite readable and each side has its own s-meter. You can simultaneously listen to both sides of the unit, which can be kind of confusing at times. Still, it has some nice applications.

Other features the unit has are: auto power off after 30 or 60 min, power saver modes, clock, auto power-on (can be used like an alarm clock by setting the scanner side to a business radio band and having the unit turn on at a specific time), backlit display lighting. The unit also has programmable sub-audible tone and repeater offset frequencies for each channel.
All in all, everything you'd probably want in a 2m HT.

The American version comes with the BP-82 battery back. This pack will last you about 3-3.5 hours in receive mode, less if you transmit. I recommend the BP-90, which allows you to use 6 AA batteries, which will last much longer. With the BP-85 12 volt battery pack the unit can transmit a full 5 Watts. I would also recommend getting the protective case (~$20).

Conclusions:

I'm quite pleased with this unit. It provides a 2m rig for the Ham and a "scanner" for those of us who don't want to carry two separate units around. It may suffer from a bit of intermod, but I find this to be more than tolerable. The scanner side antenna will probably suffice for the average enthusiast, but some will want to get the 1/8" mini to BNC female and get a different one. I would recommend this radio to anyone who wants the combined abilities of a 2m HT and a decent continuous coverage scanner.

3413. Airborne Kreepie Peepie Advice

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-01 10:18:27 UTC
From: coggs@Cogwheel.COM
Message-ID: <1992Oct1.101827.12142@uxmail.ust.hk>
Source record: 284612
Cross-posted to: rec.models.rc,rec.radio.amateur.misc,rec.video,sci.electronics

No, Kreepie Peepie is not some kind of pervert, it is ham-radio television transmitter...

We are about to purchase a (son of) Kreepie Peepie, a TXA5-RC ATV Transmitter from PC Electronics and a Chinon miniature CCD video camera from High Technology Flight. We intend to attach it to a flying model plane.

What I know so far is that several places sell these extremely cute little CCD video cameras; The board measures 2.2" x 4". It runs on 8-14volts, puts RS170 1VP-P video, and draws 78ma of current. They cost approx $200. High Tech Flight also sells a character generator overlay board which places telemetry data on the video signal.

There are a few choices for the TV transmitter board - the TXA5-RC can put out up to 1 watt. is also 2.25" by 4", You need a ham radio license to use it (got one), but I heard about there being one that doesn't require it.

Would anyone care to share their general experiences with airborne video ?

Specific q's:

Do cable-ready TV sets receive on the 462mhz frequency used by the normal ham-tv transmitter board ?

The little CCD camera is mfr'd by Chinon. Anyone have a Chinon data catalog on their shelves ?

PS) Doubtless I'll be asked this so here are the phone numbers for these places

High Tech. Flight: (313)482-2670

PC Electronics: (818)447-4565

Thanks

Bob Coggeshall

1976-1978 FCC Personal Users Radio Advisory Committee
Task force for Rules Rewrite Citizens Radio Service
Rules interpretation

1990-Current Consultant to Alinco Electronics

Currently work for Stratus Computers/Technical Support Engineering

Address: Jay_Appell@cac.stratus.com
Telephone: 1-800-458-0042 X2548

I enjoy Amtor, RTTY, and SCA reception.

I have considered putting together a DSQ primer booklet for those interested
in DSQ only. If I receive enough response I will consider the project.

If you would like to leave me mail by modem, use the BBS 1 Hopedale Center
at 508-478-6969. This is a new amateur BBS running from 7AM to 7PM EDST. The
board usually runs beyond 9PM daily. Until I can get another server, online
times will vary. We honor modems running 9600 baud/MNP 5.

Discussion groups have been setup for all ham radio vendors. Comments shared
on this BBS will be conveyed to the ham radio company referenced in the forum.
This platform will make companies aware of how the amateur radio community
feels about their products. Please indicate otherwise if you don't want the
comment forwarded.

I can help people with HF stuff, cheap antennas, and am willing to help
troubleshoot problems with rigs.

I believe that one of the pillars of ham radio - construction/
understanding at the burn-your-hand-with-a-soldering-iron level - is
drifting out of ham radio. With Japanese radios which cost so much,
fewer and fewer hams are willing to risk their warranty to service their
own equipment. I would like to see a turn-around here...

3415. WANTED: antenna design program for the Mac

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-01 12:12:51 UTC
From: steve@hacker.uucp
Message-ID: <1992Oct1.121251.16900@hacker.UUCP>
Source record: 284607
Cross-posted to: comp.sys.mac.wanted,rec.radio.amateur.misc

The subject pretty much says it all. I'm looking for an antenna design program of any sort for the Mac. Below are preferred features.

-- Draw or describe antenna elements using GUI
-- Graph antenna pattern on screen and generate output to Quickdraw or PostScript devices.
-- Able to handle multi-dimensional antenna elements
-- Source code included (C, Pascal, or Ada)

Like I said, the above would be nice, but I'll take anything I can get. In addition, if there are significant packages out there for other architectures besides the Mac, I'd like to know about them.

Thanks in advance.

Steve

>
>What would be the best orientation for the antenna? Broadside East and
>West OR North and South. I'd like to maximize the amount of DX countries
>I can work in an attempt for 5BDXCC. Not knowing the propogation paths
>most prevalent on 80 meters, I'd appreciate any experienced suggestions!
>
If you were located on the East Coast, an east-west propagation path
would be recommended. . Since you are on the West Coast and want to
have a shot at the maximum number of active countries, I wold
orient the path northeast by southwest. Europe is a tough path
for you but there are a lot of active countries on 80M. Also this
gives you a shot at the early morning long path to Europe.
A single loop has a fairly wide 3db fall-off pattern so you wouldn't
miss the West Indies area. The same goes for Japan.

However, to really get at the 80M dx on SSB you have to be able
to operate in the 3790 to 3800 window; on CW most of the dx
is in the 3500 to 3525 area.

60-70 feet up for a wire antenna on 80M isn't very effective.
90-100 would be much better. Have you considered a two
vertical setup? I think this would be much more effective
than a single loop as you can get unidirectionality.
To get a low takeoff angle for the verticals, you would
need lots of radials-- > 80 at least.

3417. Radio Shack $100 scanner - worth it?

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-01 12:47:44 UTC
From: chaz@vicorp.com
Message-ID: <1992Oct1.124744.20490@vicorp.com>
Source record: 284606

Radio Shack has recently dropped one of their hand-held VHF/UHF scanners from 140 to 100 bucks. Personally, I don't like to buy much from Radio Shack, unless I can't get it elsewhere easily, because their quality can run a bit low and their prices high (IMHO). In this case, I don't know much about the competition or scanners in general.

What do you folks think? Is it a good scanner? Does it cover the full range of interesting frequencies, or do they quietly skip over frequency ranges that, for example, their cordless telephones might use? Does it cover the most common Ham frequencies? Should I avoid RS at all costs?

Am I sending this to the correct group?

3420. Need: 12VDC 4A supply for 220V 50Hz

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-01 13:33:48 UTC
From: sysrick@orion.spd.louisville.edu
Message-ID: <sysrick.717946428@starbase.spd.louisville.edu>
Source record: 284605
Cross-posted to: sci.electronics,rec.radio.amateur.misc

Can anyone recommend a good 12V DC supply which can deliver 3.5-4 Amps continuously, and which will work off 220 Volt 50 Hz current? I have a friend who wants to set up his parents in England with a portable NTSC VCR and TV so he can send videotapes of the grandkids.

Right now, they're doing it by taking the battery out of the family car (in England) and carrying it indoors... It's a real pain, and besides, they sit it on a concrete floor and they're worried about it discharging. [Urban legend alert!]

Oh - obviously, this has to be something available at a reasonable cost (either here in the States or in England), shouldn't be too heavy, and should already be in a case (as opposed to just a power supply which needs to be put in a box).

Thanks in advance,
Rick

OK, war stories anonymous to begin ;-)

try 40 meters 1958-1961, Johnson Challenger, xtals for 7.110, 7.120, and 7.140. seems like the foreign broadcast "bought" the frequency and crystals wherever i had them!!! :-) the turkeys have been chasing me ever since. i did learn to grind my own crystals to move the critters around. but the only way to go was up.

now i'm on the low end of 40 being chased by rtty and amtor..... :-) i'll show them, i'll move to 6.999MHz. ;-)

i won't give up cw til they take my cold dead hands off the bencher!!!! remember before you start the flames, A1 emission is allowed at all allocated amateur frequencies. ;-)

3428. WANTED: antenna design info

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-01 17:19:34 UTC
From: erik@peewee.nwc.navy.mil
Message-ID: <BvGDGM.DKx@avalon.nwc.navy.mil>
Source record: 284622
Cross-posted to: comp.sys.mac.wanted,rec.radio.amateur.misc

Of particular interest is cubical quads, arrays of quads, arrays of yagis.
Is there some rule about how close or distant parallel quads or yagis in
an array must be?
How do you typically run high power and a low noise preamp at the same time?
Is there such a thing as a 1kw coupler? Where do you put your preamp
if using an array?

Can quads be built collinear for multi bands? Like this:

```
+---------------+ <-- 6m
! !
! +-------+ <------ 2m
! ! ! !
! ! ! !
! ! ! !
! +-------+ !
! !
+---------------+
```

Is there a way to make a quad V or H polarization switchable?
What about circular polarization; can you do it with two yagis 90 deg
out of phase? How about quads?

Ideally I would (also) prefer a Macintosh program for design. But
Fortran, C, Pascal, Basic code, or equations, or even (non ARRL) book
titles will help.

My desired application is EME SSB for 6 or preferably 2 meters.

I have so many questions... I belong to ARRL and don't have $$$ to buy
every antenna book they have ever published. I am only interested in
aimable HIGH GAIN stuff, the highest! I have a tolerant xyl but a
100 foot dish is out of the question unfortunately. :-)

Thanks for any info!

> Here are some questions:
>
> 1) Everybody on 2m seems to know each other already. How do I get
> involved?

Listen for a while until you find a regular group that seems interesting, then drop your callsign in during a pause and ask to join in. Most groups will welcome you aboard. Those that don't aren't worth worrying about, just go somewhere else. If the repeater you're monitoring is quiet, just say "CALLSIGN monitoring" and wait for someone to come back. Or, answer someone else doing the same thing. You won't always get an answer. Sometimes no one is listening, and sometimes those who are listening don't want to chat. Don't give up. Try at a different time, or try a different repeater. You can usually always find someone on during drive time or in the evenings. You'll often hear club meeting announcements on repeaters. Go to a few of them. Don't be shy, introduce yourself around, get to know some of the people face to face. Then when you hear them on the air, chime right in and say howdy.

> 2) There seem to be MANY repeaters in my area. If I use them, I
> should support them, right? but I can't pay dues to ALL those
> clubs. Are regular vistors welcome on open repeaters? How
> does this work?

Join *one* club that you like, if you like, and support that machine. Most machines are open and welcome anyone aboard. If you find one machine you like the best, join them. Don't worry about supporting *all* the repeaters, no one else does. Think of it as a reciprocal agreement. You welcome them on the machine you support, and they welcome you on the machine they support.

> 3) Based on what I read, apart from real emergencies, there
> appears to be no valid use for an autopatch. True?

Well *I* think so. :-) But that's just my view of things. As long as patch use isn't abusive, and the machine's owner agrees, any personal reason to use a patch is valid as long as it's in good taste and non-commercial.

> 4) Apart from the fact that I'd be unwisely broadcasting my
> creditcard number, is there a reason why a long-distance credit
> card call is inappropriate for autopatch?

Most of the machines I've used have '1' and '0' locked out as the first digits of a call. That's because the repeater owner doesn't want to get

stuck with long distance charges. If you can use your credit card without accessing the operator, there's no problem with doing so other than the one you mention. There are a lot of people listening, many not hams, and someone could call their cousin in Toyko with your card number.

> Does a long distance call violate the business use rule, as its
> furthering the business of Sprint or MCI?

Not ordinarily. If you are using the patch *strictly* to avoid making a toll call, then this used to be considered inappropriate since it is in competition with the common carrier, something amateur radio is not supposed to do. With the rules rewrites and the explosion of alternative long distance services, I'm not sure this is a valid concern anymore.

> 5) I've heard a local "net" on 10m. I mean REALLY local, all

> nothing. If I could join them some night, I'd DOUBLE my
> contacts to date !
>
> How do I do this? Would I be welcome if I just dropped my call
> in during a lull?

Perhaps. If they exchange 1010 numbers with each other *every* night, they sound a little weird. :-) Still you might find you fit right in. :-) It's always worth a try. The worst they're likely to do is harass you off the band and send a raiding party to your house in the middle of the night. You're used to that aren't you? :-)

The computer is certainly an IBM 360 programmed in spagetti assembler
by a deceased contract programmer from a low bidder IBM service bureau.
It's the *same* program that manages the commerical licensee database
and changing *anything* could crash the entire FCC file system costing
millions of dollars to reconstruct. Documentation, we don't need no
stinking documentation.

And they've only got one guy who knows how to run it, and he only works
on Thursdays. (That part's true. Amateur licenses are only run on Thursdays.)

I am currently in the market for both a full range scanner and
a new 2m HT. In this months QST, there was a review of the availble 2m
radios. Among them is the ICOM-2SRA, which got good review. I seem to
the exact person that the unit was designed for. I am looking for any
comments users have with this unit, both as a HT and a scanner. For
example, would it make more sense to buy a KENWOOD TH-28A and RADIO
SHACK Pro 38 (?), there 200 channel desk unit. Does the '2-SRA have
a seek mode? How fast is the scanning of programmed channels? Any insight
that someone may have, both the amateur world and the scanner world would
be appreciated.

Thanks,

J. Christopher Clarke

A friend of mine's son wants to start up a small, high-school broadcast station. As I understand it, he will get his 3rd class FCC permit and go from there. What I'm curious about is:

1. On what frequencies do these school stations broadcast and how much power do they run? Are the broadcasts meant to be picked up on a standard AM radio?

2. Where do they obtain the transmitters?

3. Is the 3rd class permit really necessary?

Thanks for satisfying my curiousity. I won't be seeing the boy until he visits here from New York at Xmas, and I can't wait that long to find out more!

GB2RS NEWS BROADCAST

Good morning. It's Sunday the 4th of October and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

This week we have news for Jamboree on the Air stations, microwave enthusiasts, repeater keepers and RSGB members in Shropshire; plus all the usual DX, contest, rally, propagation and club news.

The 35th Jamboree On the Air takes place over the weekend of Saturday the 17th and Sunday the 18th of October. Scouts and Guides all over the world will be using amateur radio to celebrate their shared interest. Any participating group may obtain a full list of JOTA stations by sending a large Self-Addressed Stamped Envelope to Sylvia Manco, RSGB, Lambda House, Cranborne Road, Potters Bar, Herts, postcode EN6 3JE.

The next RSGB Microwave Round Table meeting has been arranged for Sunday the 18th of October. This meeting is the scheduled Autumn event of the Southern series, now held at a range of venues across the south of England. The venue is the Flight Refuelling Amateur Radio Society Club, Wimborne, Dorset, which is signposted from the Wimborne by-pass. The meeting will start between 10.00 and 10.30am. It will feature an open forum; items under construction and complete stations; a bring and buy sale; a calibration and alignment session, and a short presentation. Further details can be obtained by telephoning Ted Jewell, G4ELM, on 0730 892462

All RSGB members should by now have received October's Radio Communication. There are several items concerning licensing: The attention of those in charge of speech, RTTY or TV repeaters is directed to the article Repeater Franchise Update on page 8. This deals with the Letter of Authority to Operate, valid until the 31st of March 1993. Repeater groups who need this letter will receive it soon. The only group which will not receive this letter is GB3BM. We apologise to the GB3GC group who were incorrectly listed in the RadCom article as not having responded. Page 6 of the same edition invites comments on a proposal to introduce Aeronautical Mobile into the UK Amateur Radio Licence. Also on page 6 is a request for data from VHF operators to assist the RSGB in preparing its submission to the Spectrum Review being carried out by the Radiocommunications Agency.

Attention RSGB members in Shropshire:

The new RLO for Shropshire is David Whalley, G4EIX, whose address is: 1 Lees Farm Drive, Madeley, Telford, Shropshire. His telephone number is 0952 588878.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Turks and Caicos,the Turks and Caicos Amateur Radio Society will sign VP500CC from Friday the 9th to Monday the 12th

of October from Grand Turk to commemorate Columbus's landfall on that island 500 years ago. From Swaziland, a group of UK amateurs will sign 3DA/G3SXW, 3DA/G3TXF and 3DA/G4FAM from Saturday the 10th to Sunday the 18th of October. They will cover the nine HF bands 160 to 10 metres using CW only. Special effort will be made to use grey-line LF openings into Europe. Sunrise time is 0320 GMT and sunset is 1600 GMT. Check these frequencies:- 1833, 3503, 7003, 10103, 14023, 18073, 21023, 24893 and 28023 kHz. They will listen between one and two kilohertz HF. From Minami Torishima, JA1KJW will be active as JA1KJW/JD1 from Iwo Jima from today until the 14th of October, on the 80 to 10 metre bands.

Rally news now, and we know of three events for today Sunday the 4th.

The Blackwood and District Amateur Radio Society Rally is being held at the Oakdale Community College, Blackwood, Gwent. Doors open at 10.30am and the event features traders, a bring and buy. Talk-in is on channel S22. The Great Lumley Radio Rally is being held at the Community Centre, Great Lumley, Nr Chester-le-Street, County Durham. Doors open at 11am, 10.30am for disabled visitors. The event features trade stands, a bring and buy, and refreshments are available. The Wincanton Radio and Electronics Rally is being held at the Wincanton Racecourse, Somerset. Doors open at 10.00am and the event features trade stands, car boot sale and refreshments will be available. Talk-in will be on channel S22.

There are three events for next Sunday the 11th of October.

The Armagh and Dungannon and District Amateur Radio Society Rally is to be held at the Gosford House Hotel, Markethill, County Armagh. Doors will open at 12.00 noon. The event features the usual traders, a bring and buy and refreshments will be available. Talk-in is on channel S22. Further details can be obtained from GI8RLE, by telephoning 0762 870423.

The Hornsea Amateur Radio Club Rally will be held at the Floral Hall, Hornsea, North Humberside. Doors will open at 11am, 10.30am for disabled visitors. The event features trade stands, a bring and buy. Further details can be obtained from G4IGY, by telephoning 0964 533331.

The South Devon Radio Club's 'Computercation 92' Computer and Radio Rally is to be held at the Hillhead Camp Site, Dartmouth Road, Brixham, Devon. Doors will open at 10.00am and the event features trade stands, car boot sale and refreshments. Talk-in will be on channel S22 via GB4CPU. Unlimited free parking and overnight camping. Further details can be obtained from G6ZRM by telephoning 0803 522216.

Next some dates for your diary.

The Conference of the World Association of Christian Radio Amateurs and Listeners will take place on Friday the 9th to Sunday the 11th of October, at the High Leigh Conference Centre, Hoddesdon, Herts. Further details are available from G4EZU, by telephoning 0474 533686. The Leicester Amateur Radio and Electronics Exhibition will take place at the Granby Halls, Aylestone Road, Leicester, during Friday the 23rd and Saturday the 24th of October. See the centre pages of October's RadCom for further details.

HF Contest news now:

During Friday the 9th of October, the next leg of the RSGB QRS Cumulative Contest will take place. This event features slow Morse and further details can be found in July's RadCom. Next weekend, Saturday the 10th and Sunday the 11th, sees the VK-ZL CW Contest. September RadCom page 14 has further details. Also next Sunday the RSGB's 21/28MHz Telephony Contest will take place between 0700 and 1900GMT. See April RadCom page 66 for further details.

Next the VHF/UHF Contest news:

The next RSGB event is the 1.3 and 2.3GHz Cumulative next Tuesday the 6th of October. It runs from 1930 to 2200GMT and June RadCom has further details.

And now the solar factual data:

This week we cover the period 21st to 27th September. Although the quiet side of the sun was looking our way with no flare activity of any note, the spot numbers and solar flux levels hardly changed. Despite this, ionospheric levels rose and HF band conditions considerably improved up to the best for over a year. Sun spot counts have been reasonably steady and meaned around 107. The solar flux levels slightly rose over the week and averaged 114 units but the day-to-day variations were very small. The geomagnetic Ap indices have been basically quiet most of the time and averaged 7.5 units, though the 24th and 27th were down to only 3 units - very quiet. The state has been nil, nothing to report, throughout the period. The radio quality indices improved up to excellent, with the Fort Collins and Tokyo circuits being extremely good. The Moscow circuits were the poorest but even so, they were above normal all the period. The aa indices, as supplied by the British Geological Survey for the period 15th to 21st September, gave a daily average of 31.6 nanoTeslas. However, the 17th was very disturbed with some aurora, and levels averaged 91.9 with periods up to 136 nanoTeslas.

Now the ionospheric data for England and Wales:

The F2 daytime critical frequencies at Slough, as reported by Appleton, averaged 9.1MHz with levels hardly changing day to day. Peak level times are now about 1400 hours. The darkness hour lows averaged 2.7MHz but there have been some periods when the ionosonde was unserviceable.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Irkutsk averaged 8.0MHz and the darkness hour lows 2.9MHz. The Ap estimated planetary Ap index which is given in GB2RS data is derived from magnetometers at College, Alaska; Goose Bay, Newfoundland; Loring, Maine; Boulder, Colorado and Upper Heyford, UK.

And lastly the solar forecast:

This week, the more active side of the sun will be looking our way and solar flux levels are expected to be about the 120s. Geomagnetic activity is expected to be mainly unsettled to quiet levels. Ionospheric MUFs during daylight are expected be about 24MHz. and the darkness hour lows 18MHz, with 14MHz being best for east/west contacts around midnight.

And that is the end of the solar information.

Finally in the main news, the licence issuing agency, SSL, has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S M and G7 N T series, and Novice calls in the 2 0 A D and 2 1 B C series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

3435. Re: Gap Vertical vs. Cushcraft R-7?

GC4properly, but it isn't foolproof. It's good policy to always coat
4a connection with silicone grease and seal it with heatshrink or
4self-vulcanizing tape, not electrical tape. If you do this, then
4crimp connectors are just as waterproof as the fancy Amphenols while
4being cheaper and easier to install.

Does the silicone grease not affect the self-vulcanising tape. At work our riggers used to wrap connectors in self-amalgamating tape and then wrap in "DENSO" tape (this is a proprietary product - sort of oil/grease soaked cloth tape). Every year or so these were replaced, often water got inside the DENSO and was trapped there.

Eventually the tape manufacturers were consulted - they were horrified at mixing "DENSO" and self-amalgamating tape. They recommended a higher quality self-amalgamating tape designed for low temperature use, this has to be warmed before applying to the connector - usually body heat is sufficient. Then just PVC tape is wrapped around to protect from UV and birds. But they stressed the connector must be kept clean and grease-free - not always possible on the top of a tower! But any grease on the surface of the connector would reduce the effectiveness of the self-amalgamating tape.

We have certainly had less problems with water in connectors since they changed over.

Someone told me that you can use 2 meter cavities (filters, as in duplexers) on 440. He said they would work, but the notches would be deeper, or something. Can someone verify this? Any info would be appreciated.

>I build myself. Besides, building is fun!
>
>I would like to build a rig which good to great RF performance. I
>have very little interest in memories and all the latest bells and
>whistles.
>

This is actually a pretty popular request, and given enough time
(a few years), I could probably develop such a project. However,
I've also come to the conclusion that very few people would
actually build such a transceiver, so I've been busy working on
stuff I consider more interesting to me. I figure that if I'm
going to spend a lot of time developing an easily duplicatable
project, it might as well be with something people are actually
going to build.

If you really want to build such a radio, I'd start off with
Wes Haywards 20 meter SSB/CW transceiver on page 148+ of QRP
Classics and add additional circuits till you get what you want.
Improvements such as expensive high level mixers aren't too
difficult if you don't constrain yourself with printed circuit
boards.

I think QRP makes more sense to the home constructor. The
transistors to generate 100 watts still aren't cheap (roughly
$30) and are easily destroyed by construction errors. Tubes
are also easily destroyed (interchanging the B+ and filament
supplies is a quick recipe for disaster). I think many
homebrewers get something working at the 5 watt level and
decide that building the amplifier isn't worth the trouble
(unless they are working on something like an EME or mode L
station that really needs the power).

Well, maybe for the same reason that people who work in media and
report on events are called *commentators*?? Is commentate a word?
I have just always used rotator for antennas and rotors for motors and
capacitors. 73, Tom WB4IUX

3442. Re: Major reorganization of rec.radio.amateur.misc

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-07 21:33:08 UTC
From: mark@adec23.uucp
Message-ID: <1992Oct7.213308.12351@adec23.uucp>
Source record: 284491

Mr Joseph M Zawodny sez:
> .bulletin - Here is where all the automatically forewarded ARRL stuff,
> DX reports, Solar info, and Special event/contest messages
> would go.
Add in the Amateurs on USENET list ...

And flloyd@l1-a.West.Sun.COM (Fred Lloyd) sez:
>I would settle for one good, moderated group.

Or Paul W. Schleck interjects:
>I wouldn't mind co-moderating a bulletin and FAQ-oriented newsgroup such
>as rec.radio.announce or rec.radio.info (similar in setup and function
>to news.answers). Naturally, this would have to be acceptable to a
>majority of the net (I have my detractors) and I would prefer if it
>rotated among several guest editors
>
>Any other volunteers?
Many of these news (DX reports et al) are already managed fine, simply get
them to post (or cross-post, see later comments) to a bulletin group.
You already have your volunteers. I have volunteered to take on the
moderated group (actually mailing list) in rec.radio.amateur.packet, but
have had NO ONE take me up on the offer ...

But then pschleck@cwis.unomaha.edu (Paul W Schleck KD3FU) counters later,
but actually he explains that this was an earlier complaint mis-posted:
>Let's not forget Brian Kantor. He gateways this newsgroup to Info-Hams
>(and *.packet to Packet-Radio and *.policy to Ham-Policy). When the
>last reorganization was discussed, he made it clear that he would only
>be gatewaying ONE main newsgroup (which is certainly his right, as it
>makes his administration simpler) and would probably arbitrarily choose
>between misc or tech (correct me if I'm wrong, Brian).

>> .bulletin - Here is where all the automatically forewarded ARRL stuff,
>There was a discussion of a rec.radio.info or rec.radio.announce
>newsgroup which would be "self-moderated" such as with news.answers
>or rec.music info. It was shot down the last time it was suggested,
>but it might be worth resurrecting again.

and finally unbham@jupiter.sun.csd.unb.ca (UNB Amateur Radio) adds:
>I don't think that the current structure should be modified, but I do
>think that maybe a moderated group should be started *just* for announcements
>(such as orbital elements, dx, rtty and space news, propagation predictions,
>etc) Trying to locate these can be a real nuisance sometimes.. One can
>only hit K so many times before one's finger gets sore :-)

**** There is a point ? ****

And now to my point. There has been a discussion going on in rec.radio.packet about a moderated group for gateway activities (ie: `clean' messages from any of the rec.radio.* groups that can be gatewayed to packet radio). It has died down much like this discussion here as no one appears to want to firmly take the bull by yhe horn (an observation, not volunteering here to do it :-).

I have had `some' e-mail contact with individuals that feel my Amateurs on USENET list is too large now to be posted to what they feel should be a discussion group `rec.radio.amateur.misc'. Granted, add in the FAQ and other postings and the beginning of the month could be a 600K hit, while flow is generally around 100K-200K.

I do NOT think there needs to be a re-organization, all that needs to be done is postings that carry high volume or bulletin content should be cross posted to the fictitious rec.radio.amateur.news group (ala sci.space.news which seems to have the same sort of bulletins anyways ... anarchy === USENET) so that anyone NOT wishing to see news items have their feed site blast this fictitious group for them ...

Or, we vote on the creation of this group, using proper USENET guidelines (can't find my copy right now, it's collecting dust under my Control Data 92181 series streaming 9 track tape drive documentation :-). Needles to say, to keep Brian Kantor happy, and the `bulletin/news/moderated' naysayers happy, we keep the messages cross posted to rec.radio.amateur.misc ...

Sorry for dredging this old (September 26th, last posting) topic, but I have seen too much complaining as of late and like to needle this one back to life.

Ciao, 73 de VE6MGS/Mark -sk- mark@ve6mgs.ampr.org

3443. AARC

>I thought a copy was ok for upgrading too.

You have to present a copy (that will go with the application) and your original license (to be returned to you after inspection) when you are at an exam.

We've had 1 case of attempted fraud locally where the perpetrator attempted to remove the class info from his license, make copies, and then type over the blank space with the new improved class. This is would be something like printing counterfeit US money using red and yellow ink instead of green.

Fortunately our friendly perp. was also in hot water with the FCC (started out attempting to renew his license with modified copies...the FCC was going to great lengths to get the perp. to come clean and then we turned up with this other attempt to fake an upgrade..

I don't believe the perpetrator is among the living today, but he did lose his license back when (wanted to go from Novice to General w/o taking the written test for it).

You can attach either the original or a copy to your 610 to send to the FCC, but you need to show the original (even if you're attaching the copy) to the VE's.

>> wait on anyone who was not one of the regular good ole' boys or appeared to

Actually, the good ol' boys don't buy anything either, so they don't get waited on, they just go in to drink the free coffee on Saturday morning.

Actually, I suspect the poster was complaining about HRO (Woodbridge) and EEB (Vienna). Neither of these stores does a lot of sales from the walk-in crowd. I've found that their prices are steep (EEB even quoted me list price on the FT-470) in the stores but competitive via the 800 number or when they're manning hamfest booths next to each other.

3452. ? Digital Delay VOX

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-08 15:52:49 UTC
From: flloyd@l1-a.West.Sun.COM
Message-ID: <ld8mahlNNki4@west.west.sun.com>
Source record: 284484

Well, I'm at my wits end trying to remember where I saw a recent construction article for a digital delay VOX unit. It was either in QST or in CQ, I can't remember which. Maybe it was Nuts and Volts?

The unit used analog digital delay chips to implement a very nice VOX circuit that did not cut off first syllables.

Can anyone on the net point me to the issue/magazine in which it was printed?

Thanks in advance,

-fred

Hmm, you can put nicads in freezers to rejuvenate them? Is this another old hams tale or what? I've successfully brought 12 volt nicad packs back to life by giving them a quick jolt of 100 VDC; haven't had one blow up yet. Better make sure there aren't any caps or diodes connected to em when you do it though.

I once put an old piece of concrete on top of a car battery, and within a week, the concrete began to look refreshed.

This really surprises me, since I've bought from him a few times.
I've never had a problem with the merchandise, and prices were
very good. I have considered mail-order from him (but he's been
at enough hamfests this season that I haven't needed to).

I'd like to hear the outcome of this. I'd be a lot happier to
hear that he's been overwhelmed by orders, rather than that
he's running a fraudulent business. I'd also like to hear
any other details about the purchase you'd care to share.

Let me ask a really basic question. What good is a "low
radiation angle" on 2m? Most of us who use 2m mobile are just
trying to hit repeaters.

furuta@cs.umd.edu (Richard Furuta) writes:

>I don't know what the current Congress did about this bill but if the

As of a couple days ago, it had been passed through the
House of(non) Representatives (dump everyone who voted for this crap)
and was on the agenda over on the Senate Side.

FYI,BTW, it is HR1674, A bill to reauthoize the FCC and to
amend the Communications Act of 1934.

>articles appearing recently in the Washington Post are any indicator, I

Screw the Post!

>public good to take away some of their toys. The FCC official quoted in the
>article sounded supportive of the legislation.

That isn't surprising. The FCC has gone somewhat pro-business
lately. Just ask us hams who lost part of our 220 MHz band......

>If the legislation is of interest to you I think it is a mistake to be
>complacent. I also think it is a mistake for us to focus on the technical
>oddities of the law (e.g., it'll make older televisions illegal as well as
>cellular telephones if read very strictly). The *intent* of the legislation
>is clear. It'll be up to the FCC to *implement* the law. I have no doubt
>that they'll be able to do so in a quite technically precise fashion should
>Congress direct them to do so.

AMEN! Do NOT be complacent, that is what the cellular lobby is
counting on. This anti-freedom crap was buried in an otherwise innocent
piece of run-of-the-mill legislation, most likely to bury it from
public view.

Get on your Senators ASAP and tell them to vote NO NO a thousand
times NO on HR1674 unless and until section 9 is removed.

If the cellular lobby special interest can ban you from owning
a radio that can let you listen to cellular frequencies, what is to
stop ANY special interest group from doing the SAME thing? And what will
end up being left? Not much.

Tell your senators THAT. Tell them also that it should not be
OUR responsibility to provide privacy for cellular users by giving
up OUR rights - rather, cellular manufacturers and users should be
required to provide and PAY for encryption for their own use.

Tell your senators that prohibition didn't stop people from obtaining
and using alcohol all those years ago. It won't stop radios, either.
All it will do is create a whole new class of criminals out of what used
to be decent citizens. There will be a whole new black market in
scanners for cell freqs.

Tell your senator that you don't want a "national radio police".

Tell your senator that if he votes for this, his ass is out,
as far as you are concerned.

I wrote all of these things in letters to both Senator Lugar
and Senator Coats of Indiana. I have always had good luck getting
replies from Lugar, we shall see how Coats responds.

FYI, Coats was one of the senators up for reelection who voted
to override Bush's veto on the Cable Bill. While this doesn't have
a direct effect on HR1674, it does make a statement about Coats.

I am investigating how Indiana's Reps voted on HR1674. If and
when I get the answer, I will post it back here. While this may not
be of much interest to folks outside of Indiana, those within Indiana
will have a better idea how to vote.....

Those elsewhere - GET ACTIVE! Oppose HR1674! Give your
congresscritters more shit than they ever DREAMED possible! Make your feelings
known!

If you act like a lemming and jump off the cliff with the rest of
the crowd, you'll get what you deserve.

> --Rick
> N3JGF

Rick - how long will it be before the kind of congresscritters
who would take away your right to *receive* will also take away your right
to TRANSMIT??????? Consider that.......

From: russell@cbnewsd.cb.att.com
Message-ID: <1992Oct8.180440.12809@cbnewsd.cb.att.com>
Source record: 284490

I have been thinking about getting a dual bander for the car. Price is
a big concern. I have seen the Alinco 590 at "close out" prices.

What are the differences between the 590 and the 599? Is the 590 a
good value?

One other lower(er) cost dual bander is the Yaesu 5200. How is this
radio compared to the 590 or 599?

Thanks for any help,

Actually, Panasonic is a division of Matsushita. It may be the case
that all Panasonic drives say "Matsushita". If so, then the drive
may actually be a Panasonic drive.

As far as what makes it inferior, without seeing the model numbers,
it's hard to say. I know that if I expected a Sony CDU-561 and got
a CDU-535, I'd be annoyed.

You might want to look into either the Comet or Diamond mobile antennas.
They're a bit pricey, but they have Gobs-o-gain. In fact, I am laying
down Heavy Hints to the XYL for their dual-band version for the Obligatory
Anniversary Present :-)

HRO or AES stock them, don't know where you are, so can't guess on
proximity to a local store...

DEFINITIONS:

Date (day only)
Possible Magnitude of Solar Flaring (LOW=C-class, MOD=M-class, HIGH=M or X)
HF Propagation Conditions for LOw, MIddle, HIgh, and POlar areas (see below)
HF Short Wave Fade Probability (in %)
HF Maximum Usable Frequency in +/- percent above seasonal normals.
HF Prediction CONfidence Level (in %)
VHF Sudden Ionospheric ENHancement Probs (in %), weighted for low-mid lats
PROBability of "s"poradic E (Es) during the UT day for low, mid and high lats
VHF AUroral BacKScatteR Probs (in %) for LOw, MIddle and HIgh Latitudes
VHF Overall Global DX Potential (in %) - weighted for Low and Middle latitudes
Geomagnetic Activity Kp Index (peak value - see below)
GeoMAGnetic Activity Ap Index (peak value - see below)
AURORAl Activity for LOw, MIddle and HIgh Latitudes (see below)
```

HF Prop. Quality rated as: EG=Extremely Good, VG=Very Good, G=Good, F=Fair,
P=Poor, VP=Very Poor, EP=Extremely Poor.
Probability of Sporadic E (Es) for the various latitudes is given in percent.
Kp Planetary Index rated: 0=V.Quiet, 1=Quiet, 2=Unstld, 3=Active, 4=V.Active,
5=Minor Storm, 6=Major Storm, 7=Maj-Sev Storm, 8=Severe Storm, 9=V.Severe.
Ap Planetary Index rated: 0-7=Quiet, 8-16=Unstld, 17-29=Active,
30-49=Minor Storm, 50-99=Major Storm, Severe Storm >=100.
Auroral Activity rated: NV=Not Visible, LO=Low, MO=Moderate, HI=High,
VH=Very High.

PEAK PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (09 OCT - 18 OCT)

```
_____________________________________________________________________
| EXTREMELY SEVERE | | | | | | | | | | HIGH |

|-------------------|---|---|---|---|---|---|---|---|---|------------|
| Geomagnetic Field |Fri|Sat|Sun|Mon|Tue|Wed|Thu|Fri|Sat|Sun| Anomaly |
| Conditions | Given in 8-hour UT intervals | Intensity |
|_____________________________________________________________________|
```

CONFIDENCE LEVEL: 60%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

60-DAY GRAPHICAL ANALYSIS OF GEOMAGNETIC ACTIVITY

-------------------------------------------------------------
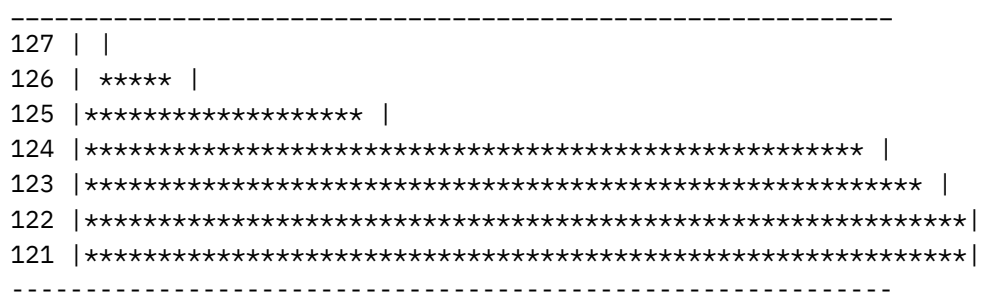
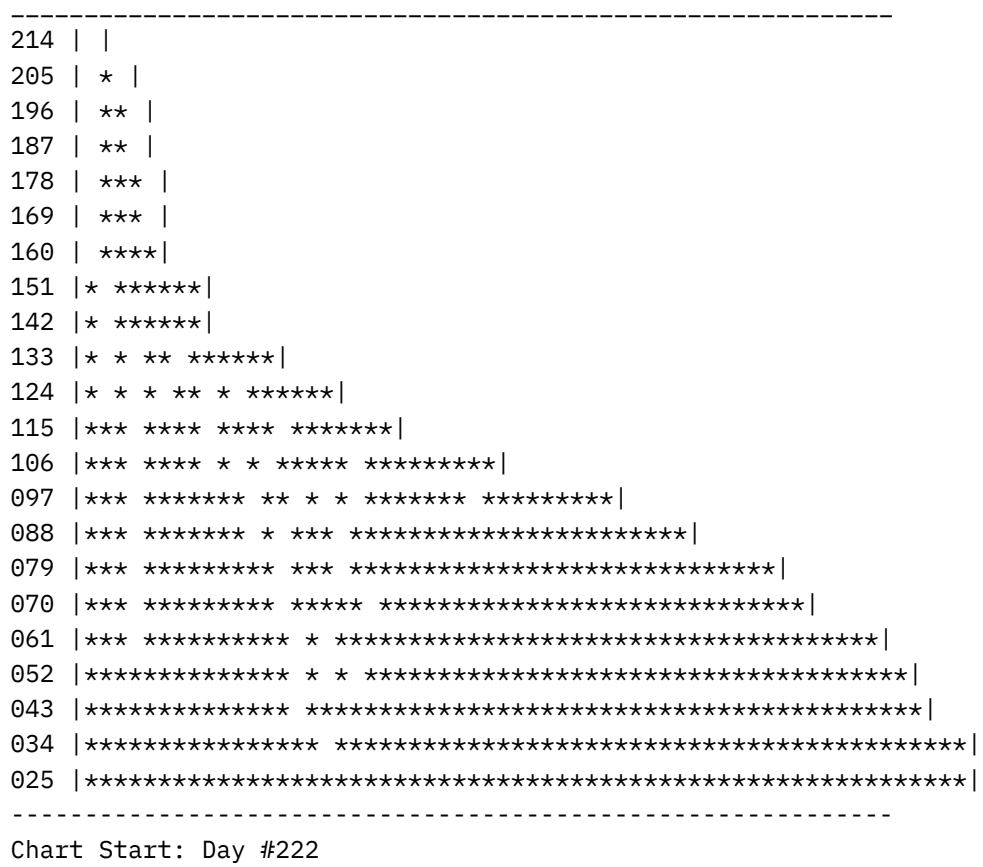
Chart Start: Day #222
```

GRAPHICAL ANALYSIS OF 90-DAY AVERAGE SOLAR FLUX



NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

CUMULATIVE GRAPHICAL CHART OF SUNSPOT NUMBERS



NOTES:
The graphical chart of sunspot numbers is created from the daily sunspot number counts as reported by the SESC.

NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "Oler@Rho.Uleth.Ca" or "COler@Solar.Stanford.Edu". This document, as well as others and related data and forecasts exist on the STD BBS at: (403) 756-3008.

I think it's possible on HAM band (137-174 MHz), but I don't think you can use CTCSS/PL thingies on wideband receiver...
But I don't have the manual at hand, sorry...

The Foothill ham flea market doesn't run through the winter.
However, the nearest one, which can serve as a suitable
substitute is the one in Livermore, which occurs on the
first Sunday of each month (you just missed it...sorry).

I don't have proper directions to it, since I've never
been the one driving or navigating to it, but I think
that the community college it's held at is called "Los
Positas CC".

Source record: 284496
Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.misc,rec.radio.amateur.packet

As easy as it is to put up a packet BBS or such, I don't blame the ARRL
or frequency coordinators for not wanting to track the changes there.
I don't have any idea about how much staff the ARRL has for this stuff,
but I think that the repeater directory is a fine, first-order approximation
to repeater frequencies for those who are travelling.
Once you get one or two frequencies in an area, the hams can point you to
other repeaters.

Maybe some packeteers should start collecting information on packet
BBS's and frequencies for a new publication? One that could cater to
the special aspects of packet networking.

How about it?

Good Luck, as a past Motorola employee, I know of other people that have tried
to do this. Your radio will not go past it's band plan without hardware.

I recommend you keep your Maxtrac in service.

Sorry for the bad news.

3476. Radio Shack Pro2006 vs AOR- AR2500

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-08 22:49:54 UTC
From: Steele.henr801c@xerox.COM
Message-ID: <"8-Oct-92.17:52:52".*.Steele.Henr801C@Xerox.com>
Source record: 284505

All Scanner Enthusiasts (Hopefully on internet),
Can anybody tell me if there are any SSB transmissions in the 1-1500Mhz range? Military,Government,etc.? I`d like to purchase a scanner with good coverage and I`m considering the Radio Shack Pro2006 [$400] (25-950Mhz with holes) and the AOR- AR2500 [$430] (1-1500Mhz). The Radio Shack radio only covers AM/FM while the AOR covers AM/FM/SSB/CW.
My question is:Do I need to receive SSB? I`d like to receive military communications as well as the normal police, fire, etc. and I know the military uses SSB in the HF bands, but I don`t know about 30Mhz and above.
Any comments, from the more experienced, on the abilities of, or modifications that can be done to, either of these two radios (or any others that fit the bill) would be appreciated. Sources of further information would also be welcomed.
Thanks,
John (N2FTS)

(packet related complaints deleted)

While we're on the subject of ARRL Repeater Directory bashing, there's another political bug in the directory. The ARRL has unilaterally decided that there are only two type of repeaters: open and closed. The other published frequency lists show three types: open, closed, and private.

Open Anyone can use it.
Closed Club or organization membership requested (not demanded).
Private Not soliciting for additional members.

What this has done is given some club and organization sponsored repeaters a bad name for operating "closed" systems that are in reality available for anyone to use.

I do not fault the ARRL for not accepting random input from any ham with entries and corrections. I maintain a small frequency list for the Monterey Bay area. I average one change per week. Have pity on the poor guy at the ARRL and armtwist the frequency co-ordination groups into supplying timely updates instead.

>transmit and receive than my 1/4 wave antennas. I can hit repeaters with
>a pretty strong signal using my 5/8 wave antenna that I can't hit at all
>with the 1/4 wave.

One other factor is that the 5/8 wave antenna is taller, so part of it
is up higher and more likely to be in the clear. It does seem to help
reduce mobile flutter.

I would recommend the Larsen 5/8 wave antenna for 2 meters only, or
the 2/70 dual band for that sort of use. These are not disguised
antennas, as they sit in the middle of the roof, but the performance
is quite a bit better than you will see from the other ones that
are not seen by eyes or RF signals.

3482. strange digital signals

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-09 00:23:44 UTC
From: sorgatz@avatar.tti.com
Message-ID: <1992Oct9.002344.21694@ttinews.tti.com>
Source record: 284510

Ok, I did RTFM and came up empty on this question. I'll gladly accept whatever assistance anyone can offer. On the HF bands, particularly in the 2-18MHz range, there seems to be a very large number of digital signals that *sound* like Baudot RTTY, BUT - they are not! My PK232 MBX (newest roms) using the SIAM mode claims these are 'unknown mode', most always at 75 or 100 baud, and interestingly enough, the ones that are at 100 baud *seem* to exhibit behavior similar to AMTOR, but never show a trace of clear text. So, the questions are:

1) What are these signals? Marine-Sitor? Telex-RTTY? Something else?

2) Is there a chance to decode them using the PK232MBX? (I did try the BITENV command up to the $1f limit at various baud rates and in the various codes, no luck. I have not yet tried the 5-bit gambit, 6-bit didnt work either.)

3) What commercial equipment is used to transmit and receive these types of traffic?

post it here, or email it to me and thanks for any help, 73!

Fingernail polish works well, but you have to paint on all the traces.
For ICs you just paint a stripe that connects all the leads on one side,
then when it is semi-dry you cut between the lead with an X-acto.
Works pretty well for low density boards. Cleans up real fast with
fingernail polish remover (acetone).

>
It seems to me that the packet stuff is evolving and changing so fast
that the ARRL ought to just drop it from the repeater directory.
It seems like a bit of a mismatch anyway ('course, then there's the
listing of Beacons!! Sheesh.)

> Maybe some packeteers should start collecting information on packet

One of the techs at Icom told me about some of the prototype modules they
have around there; SSB on 10, 6, 220, and 430. Of course, just because
they've been prototyped doesn't mean they'll ever be produced.

I could get into a 10 SSB module, and a 430 SSB opens up some interesting
possibilities for mobile OSCAR...

To all radio amateurs

SB DX ARL ARLD051
ARLD051 DX news

Thanks to Tedd, KB8NW, and the Ohio/Penn PacketCluster Network for
the following DX information.

MADAGASCAR. George, 5R8AB, ex-5R8GW, has been active on 21260 kHz
from around 1600z until 1930z. QSL via F6FNU.

UGANDA. Dr Wilfried Ruppert, DJ5RT, will be returning in late
November and use the call 5X5WR. QSOs made by Dr. Wilifried are
accepted for DXCC credit.

BAHAMAS. WA4YVN, WA4VQD, KI4LP, WA4EMU and KE5DP will sign C6AHI
from Bimini Islands for the CQ WW DX SSB Contest October 24 and 25.
If time permits before and after this multi-single effort, the group
will be active on CW and RTTY from this IOTA location number NA-048.
QSL via WA3YVN, PO Box 2235, Melbourne, FL 32902.

SAINT VINCENT. Harry, W8KKF, will be active beginning late October
22 through the CQ WW DX SSB Contest weekend. During the contest
look for J80D. Outside contest hours Harry will sign J8/W8KKF. QSL
to W8KKF with SASE.

OGASAWARA. JA1KJW is signing JA1KJW/JD1 until October 14. He was
heard around 7008 kHz at 1330z. QSL to CBA.

FERNANDO DE NORONHA. Ary, PP1CZ, and several other ops will be
active from October 17 until month end using their home calls /PY0F.
They will be operating multi-single in the CQ WW SSB Contest with
the call sign PU0F.

NIUE ISLAND. Marcel, ON4QM, is now enroute and plans to operate as
ZK2X. Further travels include Tokelau, Nauru and Tonga.
```

NAMIBIA. V51E has been quite active on 28493 kHz from 1500 to 1700z. QSL to K8EFS.

ANTARCTICA. Gavin, VP8GAV, has been quite active on 20, 40 and 80 meter CW. He seems to start his activity on 20 meters around 0100z and then moves to 40 meters around 0200z. Check the first 5 to 15 kHz up from the band edges. He has been heard around 0400z on 3501 kHz. QSL to GM0LVI.

SAN FELIX. John, XQ0X, should resume operations here this month during his four month stay.

WALLIS ISLAND. A Japanese group will be active from October 28 to November 3. Some RTTY operation is now under consideration.

DX BITS. Ed, NT2X, has the 9D0RR cards in hand and will be getting the QSLs out in the next few weeks. VP8SSI operator Tony, WA4JQS, says there is a possibility of another DXpedition to Peter I Island in 2 years. All depends upon obtaining licenses and landing permission. FR5ZU/E has cancelled his trip to Juan de Nova.
NNNN

Good Luck on DX de KB8NW/OBS

>Man that seems a little childish from my viewpoint since Matsushita is
>ACTUALLY PANASONIC. Whats the big deal? Besides what makes it "inferior"
>to a supposed REAL panasonic labelled device anyway.

I can understand your viewpoint since you lack the ability to distinguish
between Matsushita which is Panasonic's parent and Matshita which is
a Korean company. The USED (I assume you'd have problems paying new
prices and getting used equipment) Matshita was a flimsy piece of sh*t
made out of metal about the gauge of beer cans and lacking enough drive
to spin up the CD long enough to even get a directory.

Is that clearer now?

BTW, I've received mail from two other people who have been ripped
by these people in a manner similar to me and my friend. Maybe
you ought to order something from them and see what you get.

>I'd like to hear the outcome of this. I'd be a lot happier to
>hear that he's been overwhelmed by orders, rather than that
>he's running a fraudulent business. I'd also like to hear
>any other details about the purchase you'd care to share.

I posted most of the details. They promised to ship the Panasonic drive
the week after the fest. We started calling two weeks after the fest.
This evolved to mailed and faxed letters. We received the used and
defective off-brand drive in response to a fairly hostile letter. My
friend who did NOT get hostile never got anything. I returned
the drive immediately after testing it. They originally claimed they
were going to charge me a 30% (!) restocking fee. I pointed out in
another faxed letter the fact that I'd paid for a Panasonic drive and
they dropped that bit. Every subsequent phone call got me a promise
the check would be mailed immediately. Several more faxes got nothing.
My friend and I had been talking about this topic every few days.
He demanded a refund about the time I send the defective drive back.
He got the same promises I did. I finally contacted the Clayton Prosecutors
and followed their instructions. The letter I posted was faxed on a
Friday and the envelope bearing the check was postmarked Saturday.
The check was backdated to mid-September and was for less than the
full amount owed.

Since I posted my note, I've received Email from two others who have been
ripped in a similar manner. One was at Comdex last year. I don't
recall the location of the other. I've asked both to send me a
paper copy of their note so I can forward it to the Prosecutor. This
should be enough to start a federal case. I hope they will post publicly.
I won't post private Email.

My suspicion is MAX got strapped for money and is ordering merchandise
only when they can pay the COD bills from customer deposits. My check
was cashed the day after the hamfest (Monday) which lends credibility
to this theory.

John

I don't understand it... you gave a substantial amount of money to a stranger
in return for their promise they would quickly ship you a product they didn't
have at the time?

AHAHAHAHAHAH, HOHOHOHOHOHOHO, really???!!!???

A Fool and his money are soon parted...

Caveat Emptor...

[other cliches]

On the other hand, the 'Smart Shopper' would;

1.) Purchase via Credit card.
You can return ANYTHING within 30 days and pay nothing. All you need
do is call your credit card company, indicate that you are 'unsatisfied'
with your purchase. Then ship the offending item back to the vendor, get
a shipping receipt (insure the package optionaly, I send it back COD)
and mail a copy of the purchase and return shipping receipt, VOILA!

Your account is credited the FULL amount of purchase.

This is federal law. This is why direct marketing (mail order) ALWAYS
offers '30 days satisfaction guarantee!' It's Federal Credit Law. Might
as well offer it as a feature. Some offer an additional 30 days, but
impose restocking fees during this period.

2.) Insist on rapid delivery.
If a legitimate vendor has equipment for sale, they'll ship it
very quickly. If not, they won't. Common sense. If you're buying
in person, either they have it, or they don't. If you're buying
by mail, or telephone, determine when the item will ship. If it
doesn't arrive as specified, insist on the shipper number from
the vendor (if they won't/can't give it to you, get suspicious)
then track it YOURSELF with the shipper. Get ready to immediately
pursue item #1 above...

Common sense will avoid these sad stories as we've read here. Protect
your rights!

3493. Six-Meter DXpedition

Newsgroup: rec.radio.amateur.misc

W6JKV expects to operate as FG/W6JKV from Guadeloupe, FWI, from about 23 Oct to 9 Nov, 1992, on 6-m SSB/CW. He will also be on 2-m EME with his monster 54-ft-long Yagi. Jimmy has rented the same place I used in 1983 and 1990, which was VERY quiet radio-noise-wise.

Pass the word.

>the newer handheld that prevents the ICOM headset from working?

Well, Icom and Yaesu both use the leaky PTT method, but Icom units use
about a 10k leak and Yaesu wants about 2.2k. My older FT470 works fine
with my older Icom accessories, but I've seen this problem with other
units. Sounds like Yaesu changed something that's requiring a higher
current draw on the leak in the newer radio to activate the PTT. I'd
suggest changing the leak resistor in the HS-10 to a lower value and
see if that works. You'll have to up the mic gain to make up for the
extra load.

schumach@convex.com (Richard A. Schumacher) wrote:

> Presumably this was produced under license from the
> patent and copyright holder? I doubt it.

Your doubt is correct. The Smith chart program I wrote for PostScript printers is a shameless rip-off of the 1966 version of Phillip Smith's impedance chart, for which the Kay Electric Co. was licensed to publish. The header clearly declares its reproduction without permission.

> Don't cheat the inventor and his heirs. Go out and
> buy a licensed copy. The patent rights and royalties
> you protect may be your own.

Well, this IS an interesting point of view. I agree with you in principle; there is too much thievery of intellectual property going on today. I, too, sought to purchase and employ the "real thing", but was stopped by a phenomenon which is fairly recent: nobody with money buys Smith Charts, rather they buy $10K microwave modeling software packages.

Now, I had hoped to purchase some charts from Kay Electric, but I was unable to find a listing for them in the latest Microwaves & RF Buyer's Guide. I also found that no one else was selling these charts, for the reason that NO ONE IS BUYING THESE CHARTS (except perhaps students, but they couldn't possibly represent a serious market share).

I consulted the ARRL's book service, and found them generously selling a degenerated copy of the chart (nowhere near as useful as Kay's) for about $1.00/sheet.

So, being the resourceful student I was (*ironic smirk*), I wrote a PostScript program to draw the Chart for use in my classes. When I convinced myself of its fidelity to the original, I prepended a "public domain only" disclaimer to it and uploaded it to simtel20.wsmr.army.mil, where is still resides in <MISC.HAMRADIO>.

I've never told anyone this because it never came up and I didn't want to decrease the SNR on sci.electronics and rec.radio.amateur.misc.

Are Smith's heirs being cheated by my PostScript program? I doubt it.

Are they being cheated by the countless software companies in whose software the chart (specifically the insightful bilinear transform it represents) is an absolutely essential part? Probably.

I don't care, and won't until I hear from the Smith estate's lawyers.

Last review i heard about AOR 2500 is . Avoid it
it might sound remarkable on the Freq. range etc
but it has below average construction and sensitivity.
you just get what you pay for . if you really want
full cover in freq and modes then AOR 3000 is the
one but it is pricey +- 1000 bucks . else
stay with pro2006.

I still wish pro2006 has full cover and all modes

>(stuff deleted)

Here's the main point for the CQ WW contest; make sure you update your contest logging program (CT, NA, etc) to reflect both the new prefix and country:

>Plese note, that DXCC status of Slovenia is obvious, the
>only question still discussed in ARRL DXAC is starting date
>in 1991 ! So, if you worked any Slovenian station, you
>alredy have Slovenia worked. Also, Slovenia is separate WAE
>entity, thus valid as multiplier in CQ WW contest.
>
>Best regards de Iztok, YU3FK @ YT3A.SLO.EU

I don't know when the DXAC vote will be completed, but probably not in time for the CQWW the last weekend of this month. So, my plan is to go ahead and count any S5's for a contest multiplier and let CQ take it out if they don't approve.

One of our variable-voltage supplies (Heathkit IP-27) has lost its power transformer. We are ordering a few new supplies for next year, but we really like our old Heath. If anyone has a basket case with a good transformer, or a spare transformer part #54-180, please send email or contact me here at ARRL HQ. Heathkit does not have the part in stock.

By the way, I had to go through several layers of changed numbers and voice mail to get to the Heathkit parts center. Here is a direct number for Heathkit parts: (616) 925-5899.

Most of the 75 Bd/850 Hz signals you heard are USN and NATO
encrypted traffic. You did not give freqs for the other stuff so it
is hard to say but I suspect you are seeing the
French mode sometimes called TDM2 or Moore 2-channel. It transmits
2 channels simultaneously at 96 BD. There are several products
that will copy this mode and also modes such as ARQ-E, ARQ-E3, FEC-A,
and FEC-S. One of them is the Universal M-6000/M-7000/M-8000 series
--around $1000--I have aboth an M-70000 and M-8000. Also another
decoder called the Hoka will do it. Unviversal is in Reynoldsburg,
Ohio.
They also sell books by a German (in english) named Klingenfuss that
discuss these modes and list freqs.

This reminds me of the name and address gathering training film that RS use
to show us from time to time. There was a character in the film whose name
was "C. B. Rig". The RS alumni will remember this film the rest of you may
let your imaginations run wild. The two of them must have been related.

:-)

There was an equally humorous letter received by RS regarding a relationship
between aborted human fetus brains and computer memory. I wonder if anybody
has that letter sitting around. If not I can paraphase it however, it will
lose something in the translation as this was about ten years ago.

3506. Help with design of 70cm Franklin Array

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-09 15:32:52 UTC
From: rdewan@casbah.acns.nwu.edu
Message-ID: <1992Oct9.153252.22725@news.acns.nwu.edu>
Source record: 284530

I am going to build a Franklin Array (collinear 1/2 waves end fed)
for the 70cm band.

```
|
|
|
|
|
+-----+
| 1/4 wave stub
+-----+
|
|
|
|
```

and so on (about 3 half waves in all, more if it's still rigid) to
a 1/4 wave feedpoint matching section to 50ohm coax
(j-pole style feed)

```
|
| |
| |
| |<feed point for minimum swr
+-+
|
```

support and ground for lightning protection

I am planning to build this out of 1/2" (abt 2% of the wl) cu pipe.
I have a couple of questions:

Q: Should I make a correction to the length of elements
calculated from 492'/FMHz to account for the thick conductors?

Q: How should the length of the 1/4 wave phasing stubs be measured?
Some options: a) from center of the vertical 1/2 wave sections
to the center of the vertical part of the stub
b) length of the horizontal piece (including length
of horizontal parts of any elbows)

My guesses are to:
(1) Use the chart in the arrl antenna book for lengths of dipoles for
different wire thicknesses to correct the lenght of stubs and 1/2
wave elements and
(2) Measure the length as in option (a) above. The logic being that
the inner surface will be inductive and the outer rf paths will
be capacitative and in the balance, center to center should be ok.

What do you think??

Now that I think of it, I could also finesse the problem by figuring out the lengths by experimentation. I could put the 1/4 wave section in line with the center conductor of a feed line to an antenna and null the reception of a signal by varying the length of the stub. The deepest null would provide the correct length.

This has gotten longer than I anticipated. :)

I await your thoughts.

Sincerely,

Rajiv

3508. SAREX Contact Video - Raleigh, NC - Students Talk to Curtis Brown on Endeavor

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-09 15:38:30 UTC
From: gcasey@brtph418.bnr.ca
Message-ID: <1992Oct09.153830.25065@brtph560.bnr.ca>
Source record: 284536

The Raleigh Amateur Radio Society and the Wake County (North Carolina) School System completed their successful SAREX Space Shuttle contact on September 17, 1992.
A 20 minute video is available documenting both our practice run on September 12, an unsuccessful first attempt on September 16th, and the complete contact on the 17th.
This contact lasted about 9 minutes -- from horizon to horizon, plus maybe a few extra seconds via scatter propagation. The signals from the shuttle were super-solid. Four students asked a total of 14 questions.
The tape provides excellent documentation of this exciting event. RARS is making copies available for $8 each, plus $4 for First Class US Mail shipping (total of $12). This covers cost of duplication and shipping. (All productions costs were donated, and RARS is not in the videotape business, so this is not a "commercial" offer.)
To get a copy, send a check for $12 made out to Gary Pearce KN4AQ, 4400 Bleeker Ct., Raleigh, NC 27606. Tell me where you want the tape shipped.
In addition, 5 press releases are available from the event. We received excellent press coverage on statewide TV, Radio and Newspapers. If you would like a copy of the press releases, include your request. There's no extra charge.
73,
Gary KN4AQ

[Note: If your outside of the US, please send additional funding to allow for international shipping. Great illustration of amateur radio. - Errol Casey]

Well, the first sentance of my post didn't make it, obviously.

It should have read: Does anyone know the correct address/company that services RCA commercial radios? Used to be TAC-TEC, but I believe they were bought out by another. Anyone have the facts?

3510. Need help with relay driver circuit

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-09 16:49:58 UTC
From: heacock@kuhub.cc.ukans.edu
Message-ID: <1992Oct9.114958.43705@kuhub.cc.ukans.edu>
Source record: 284533
Cross-posted to: rec.radio.amateur.misc,sci.electronics

I built a sidetone oscillator/relay keyer for my Drake TR3 HF transceiver, using a pair of 2N2222's as NPN switches. One of them switches on a 555-based audio-frequency sidetone oscillator, the other one is a relay driver. Everything worked fine on the breadboard. Everything worked fine when I built it into a case. Then I plugged it into the rig and tried keying the rig with it. As soon as I closed the key, the relay latched up and wouldn't release.

I went back to the article that inspired the project, an article in the ARRL publication, _QRP Classics_, on electronic switching. The text recommended putting two diodes in series with the emitter of the relay driver transistor, to establish a reverse bias that would prevent leakage current from keeping the relay coil energized. I made this modification and tried it again. At first I thought the problem was solved, but I found that if I increased the output of my transmitter much beyond about 35 watts (into a dummy load), the relay latched up again. Below that power output, the circuit worked fine.

Anyone have any idea what's going on here? The circuit seems to work just fine except when it is actually keying the transmitter. Could it be that there is some RF energy that is keeping the relay coil energized? If so, how can I get rid of it? Suggestions?

Thanks in advance.

The Delco Voyager 105Ah is $53 at our local COSTCO. I bought one this spring to power my 2m rig in the house and it works great. I have it installed in a plastic case which you can buy from K-Mart. I think it is designed for marine use to keep your battery clean or something.

Anyway, here is my recommendation!

Why do I feel like I should be grunting and making other "manly"
sounds while reading this message? A REAL antenna, made in the USA.
Comes complete with American flag to fly at the top of this 57"
wonder. Requires you to drill a hole, no, SAW a hole, as REAL
men take REAL antennas and dril REAL holes in their big Ford LTDs
and Lincolns.

Sorry...but I just thought it sounded kinda funny. :-) :-) :-)

>
> 30 M: 10.140 - 10.150 MHz

TWENTY PERCENT OF THE BAND SPACE! I think that this way too much
on a band that is a haven for non-contesting cw operators.
How about *no* allocations on this band. Consider the fact that
the max power is 200W. This would heighten the hidden transmitter problem
in AX.25 style (or any carrier sense multiple access) operation.

>
> 40 M: 7.100 - 7.110 MHz
> 80 M: 3.620 - 3.635 MHz
>
> 160M: 1.810 - 1.820 MH
>

Whoa!! This is just about the hub of cw activity on this band. Of my
last 10 cw contacts on this band, eight are in this segment. In my mind
this is like requesting 50Kcs in the 28.3 to 28.5 band.

Nuts.

I am absolutely opposed to this. Time for a letter to my division director.
It seems that the commitee has no clue about cw operations in this most
elegant of all bands.

Please stop this nonsense before it becomes a part of the regs.

Note the lack of any smileys. I AM NOT SMILING OVER THIS RIDICULOUS
IDEA OF DEVOTING A PRIME PART OF 160 TO UNATTENDED AUTOMATIC DIGITAL MODES.

I am sure that we all have our own favorite parts of the band and I am sure
that we will hear from others. That is fine. That is their right.
It does seem to me that the bottom end of 160 has been and is the center of
all cw fun in this band and hence this proposal is against tradition and
the commitee's stated position of accepting existing norms on the bands.

Amazingly I have had the exact same experience with the Radio
Shack version of the Technical no-code license guide. All
of the local stores have been consistently out of stock and
back-ordered, and report that the distribution center doesn't
them either. After waiting endless months, I happened to be
at a local hamfest that was attended by amateur radio vendor
Lentini Electronics of Newington, CT (yes home of ARRL). Lo
and behold, he had a pile of these books published with the
original cover (not with the Tandy recovering) for $10 a piece.
I immediately bought one and found it to be identical to the
Tandy release. You might try calling Alex Lentini (they
advertise in QST and have an 800 number). Surely if he has
one and you have a credit card he will send it to you for
the $10 plus p&h.

(You might try buying a lot of them and becoming the bay area
black market source for these books ;-) !!!)

Good luck Maxine.

The problem with this REVISED proposal is that they still assume that semiautomatic operation (one attended/one nonattended station) is sufficient to prevent interference.

This is just plain wrong. The operator of the attended station is in no position to tell when the unattended station is interfering with another station. There is no way for the interfered with stations to tell the unattended station (or the attended) station that they are interfering with them. As an AMTOR user on 20 meters, I am already suffering interference to my station from unattended APLINK bulletin boards operating in the attended/unattended manner the league suggests.

I'd suggest that all unattended operation be restricted to the proposed automatic control subbands (even if this means that they need to be made a little wider.

Report and Recommendation
to the ARRL Board of Directors, from the
ARRL Committee on Amateur Radio Digital Communications
September 26, 1992

At the request of the ARRL Board of Directors, the ARRL Digital Committee met today with five elected representatives from the group of amateurs operating automatic HF message forwarding stations under FCC Special Temporary Authority originally dated July 7, 1987. What follows supersedes and replaces the Committee's June 13 report.

Additional data, not available at the time of the Committee's June 13 meeting, included:

A. Revised IARU Region 2 band plan resulting from the September 4, 1992 meeting in Curacao.

B. Additional feedback from amateurs at large, and the STA community, received since the June 13 meeting.

The committee is revising its previous recommendation to include fully-automatic, unattended operation on the IARU "packet priority" sub-bands and semiautomatic operation in all digital sub-bands.

IARU Band Plan

The Digital Committee, at its June 13 meeting, was concerned about frequency usage and allocation in the US. and other countries, in effect at that time.

The September 4, 1992 IARU Region 2 meeting in Curacao produced a substantially revised band plan for digital modes. The new plan includes segments on all amateur bands between 80 and 10 meters for "digital modes," defined as including RTTY, AMTOR and packet (including new systems like PACTOR and CLOVER), but not FAX and SSTV. Within those segments, "packet priority" sub-bands were defined (except on 40 meters) in which digital modes other than packet are permitted, but may not claim protection from packet. It was agreed that CW remains a permitted mode throughout all amateur bands.

The Digital Committee and STA representatives believe strongly
that no distinction should be drawn -- in terms of spectrum usage --
between digital modes. Technology development is advancing quickly.
Any mode could be outdated and replaced with better, more efficient
technologies at any time. Mode-specific plans will limit spectrum for
development, and may reserve spectrum for modes soon to be obsolete.

For that reason, and in light of what follows, the Committee prefers the
term, "automatic priority," instead of the IARU's term, "packet priority."
The Committee believes the following recommendations will better
align the US. band plan to the IARU Region 2 agreement.

Additional Feedback Received

There is reason to believe that many VHF and UHF operators
overlooked the QST survey, assuming a "below 50 MHz" issue had little
effect on them. The impact on message traffic between widely separated
VHF and UHF packet bulletin boards was not immediately understood.

As mentioned in the Committee's June 13 report, every Committee
member read every written comment submitted by the respondents.
Those comments emphasized areas of great concern by many amateurs,
and significantly influenced the Committee's previous recommendation.
The concerns remain quite valid. The Committee believes new means are
now available to address them, while, at the same time, enabling
additional activities and developments that will benefit amateurs and the
public interest.

A primary concern, among many amateurs is interference to
stations under human control by stations under computer control.
Except for a very few special situations, by tradition (and rule), one
amateur station must not willingly or knowingly interfere with a contact
already in progress, regardless of mode or the perceived importance of
the communication in progress.

Semiautomatic operation has been defined by the Committee as
requiring a local control operator at the calling station, to guard against
interference to existing communications. The station being called
operates automatically, but on a "speak only when spoken to" basis.
Semiautomatic operation received a 2:1 majority (those favoring vs. those
opposed) in the QST survey. The Committee interprets that response as
a strong vote in favor of automated message handling, provided it can be
a "good neighbor" to other spectrum users.

Initial survey respondents, while not favoring automatic operation,
said (if automatic operation is permitted) they preferred sub-bands by a
4:1 ratio over any other proposed scheme. They did not favor the idea of
exclusive sub-bands for specific modes.

The STA participants point to their commendable record in creating
a nationwide network for moving hundreds of thousands of messages
efficiently and without technical difficulties. Their efforts have lived up to
Part 97.1 (a), Basis and Purpose of the Amateur Service, "Recognition
and enhancement of the value of the amateur service to the public as a

voluntary noncommercial communications service, particularly with respect to providing emergency communications."

Countless pieces of traffic have been transported in national and worldwide emergency situations. Messages of a "hobby" nature have been an important vehicle allowing the network to be developed and maintained in a state of readiness.

The technical effort required to construct this network, both in hardware and software technology has been considerable, and certainly meets 97.1(b), "Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art."

Thousands of bulletin board operators (sysops) and tens or hundreds of thousands of digital operators have learned to originate, relay and deliver message traffic by means not previously available. Part 97.1(d), "Expansion of the existing reservoir within the amateur radio service of trained operators, technicians and electronics experts," has also been served.

There is no question of the value provided by this message network to other amateurs and to the public at large. The Committee acknowledges the success, both technically and functionally, of the STA experiment. There have been a few reports of interference to foreign phone stations where international band plans conflict. There are few if any reports of problems with other US stations. The IARU accord minimizes or eliminates the concern for interference to foreign stations.

A major concern had remained, however, that unrestricted HF automatic operation permitted to all General, Advanced or Amateur Extra class licensees, could easily result in interference to other stations on a completely unacceptable level. Subdivision of bands by rule was previously rejected, in part because, "it will not work on a world wide basis because of the differences in the rules between regions and between individual administrations." The IARU has now provided a subdivision plan which has already met with international approval.

RECOMMENDATIONS

I. The Committee wishes to enable as many amateur licensees as possible to contribute to, and enjoy, our service. The previous recommendation stands, to permit semiautomatic operation in any digital portion of any band. This privilege will permit a variety of experimentation and operations such as personal mailboxes and MSOs to co-exist with "live" users, on a non-interference basis.

II. By using the IARU Region 2 band plan, US operation will be in compliance with international agreement. Since the sub-bands designated by the IARU as "packet priority" will offer no protection from interference to other users of that space, including US amateurs, the Committee proposes fully-automatic operation by US amateurs within those segments of the band, using any approved digital data mode. It is recommended that those segments be

dubbed "automatic priority," as a more accurate, descriptive term.

III No packet priority segment was specified by the IARU on 40 meters, yet automatic networks have been operating there since the beginning of the STA. As we approach the sunspot minimum, and the MUF lowers, 40 meters will be badly needed for many propagation paths. The Committee therefor urges approval of a small automatic priority segment from 7.100 to 7.110 MHz.

Similarly, no digital segment was specified by the IARU for 160 meters. While there is little or no digital activity on this band, developing modes show promise of improving operation in this somewhat hostile (digitally) environment. The Committee feels it would be a valuable testing ground, and requests an automatic priority segment from 1810 to 1820 KHz. Specific frequencies recommended for automatic priority are listed in Appendix B

IV. The Committee cannot overemphasize our concern for protecting other spectrum users from the potential interference of automatic stations. To this end, the recommendation for automatic operation is made on the basis that protection by rule will be provided in the form of specific sub-bands to which fully automatic operation is restricted.

There is precedent for special use, by-rule sub-bands, as in 97.203(d) for beacon stations. Any other usage plans, within digital segments, should be by voluntary plan, not by rule.

The requested sub-bands should not place an additional enforcement burden on the FCC. Amateurs have always been largely self-regulating. The committee views the requested rules not as something else the FCC must spend time monitoring, but rather tools to enforce reported infractions.

V. By current standards, AX.25 is considered the least efficient protocol in use for digital modes. The STA representatives request, and the Committee wholeheartedly agrees, that AX.25 protocol be struck from 97.109(e) as a requirement, and replaced with the ability to use any accepted digital protocol.

Because the investment in technology development is large, developers hesitate to widely publish details (competitive disadvantage) in the early stages. To address this issue, it is proposed that developers be allowed the latitude to use new protocols, during the development phases, so long as they file details of the protocol, privately, with the ARRL.

VI. Because digital technologies are developing rapidly, the Committee proposes to compile, and provide to the Board, a proposal for any desirable adjustments to Region 2 band planning, prior to future IARU Region 2 conferences.

VII. The Committee reinforces its previous suggestion that the League undertake publication of a tutorial-style operator's guide for HF digital operations clearly defining acceptable operating practices, voluntary-use band plans, DX windows and beacon frequencies.

Appendix A

The following is suggested wording for an addition to Part 97 authorizing automatic and semiautomatic digital mode operation. Note that RTTY, AMTOR, packet, CLOVER, PACTOR and future digital data modes are treated equally as "digital modes."

97.3 Definitions

( ) Unattended Digital Station - A station in the amateur service, using any accepted digital mode protocol for data or message transmission, and operated without a local control operator present.

( ) Semiautomatic operation - A two-way communication in which the control operator of a locally controlled amateur station manually initiates, monitors and controls communication between that station and an unattended digital station.

97.109 (e) No station may be automatically controlled while transmitting third-party communications, except a station retransmitting digital radio communications using an accepted protocol on the 6m and shorter wavelength bands, or on 10m and longer wavelength bands in sub-bands where automatic control is specifically authorized. The retransmitted messages must originate at a station that is being locally or remotely controlled.

97.216 Unattended Digital Station

(a) Any amateur station licensed to a holder of a General, Advanced or Amateur Extra Class license may be an unattended digital station.

(b) An unattended digital station may operate on any frequency authorized for digital transmission modes.

(c) No unattended digital station may initiate contact with another station or broadcast any undirected signal unless operating in a band or band segment where fully-automatic operation is authorized.

(d) The transmitter of an unattended digital station must be equipped with a functioning time-out timer that will insure no signal is transmitted for longer than five minutes in the event of the malfunction of control equipment or loss of contact with another station.

(e) Unless operating in a band segment where fully-automatic operation is authorized, the control operator initiating contact with an unattended digital station must be present at the local control point. The control operator must first ascertain that no interference will be caused to existing communications, must remain present for the duration of the contact, and must discontinue the contact if it becomes evident that communications with the unattended digital station is interfering with

other amateur communications.

Appendix B

It is recommended that all stations under automatic control be
restricted to the following Sub-bands...

10 M: 28.120 - 28.189 MHz

12 M: 24.925 - 24.930 MHz

15 M: 21.090 - 21.125 MHz

17 M: 18.105 - 18.110 MHz

20 M: 14.095 - 14.0995 MHz
14.1005 - 14.112 MHz

30 M: 10.140 - 10.150 MHz

40 M: 7.100 - 7.110 MHz
80 M: 3.620 - 3.635 MHz

160M: 1.810 - 1.820 MH

The nonsense here is of my own making - no one else would want credit!

3519. Alinco 599 comments

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-09 17:59:40 UTC
From: wejones@crdec7.apgea.army.mil
Message-ID: <9210091357.aa00850@crdec7.apgea.army.mil>
Source record: 284541

I have owned an Alinco DR599 for about 7 months now, and thought I should make a few comments on its operation. Feature wise, as I think obvious from the ads, the radio is very nice, it can do everything I have interest in doing, and the removable front panel is nice for those like myself who don't have room under the dash for a full sized unit. As far as operation is concerned, I have received good reports relative to the quality of my signals even at sizeable distances. The receiver gives fairly good quality sound, better than the Radio Shack HTX202 and better than any of the scanners I own, but not as good as a Yaesu 736, but that is to be expected. The problems I have observed are:

1. The unit seems to be susceptable to front end overload on receive. If I park near another ham who is transmitting to a repeater, I cannot listen to his side of the conversation at all, whereas he has no problem with his 202 when I am transmitting. I guess that this is to be expected also, since single banded tranceivers without extended receive generally have better filtering.
2. Possibly related to the above, the unit seems susceptable to receiving strong out of band signals, like pagers, etc.
3. I use the unit for packet, and it works well, except it seems to take a bit longer to sync up both on transmit and receive, so that I had to increase the time interval prior to start sending data, and have had minor problems with some stations that have not increased this parameter.
4. The unit seems very sensitive to low power. I commonly operate off a cigarette lighter power cord "Y", and the extra resistance will not let me transmit (can hit repeaters, but audio is too garbled for people to understand me) at high power if I turn off the engine of the car. Working off a 12 volt battery with a solid connection works fine, as does dropping back to low or mid power (I had accidently bumped the unit into high power when I discovered this problem). Apparently there is a voltage threshold near 12 volts below which the unit doesn't work well, and the extra voltage from the alternator keeps me above this threshold even with the poor connections.
5. The strangest problem I have run into is when I recently tried to connect an extension speaker to the 2-meter speaker jack. At first, this seemed to work well, since 2-meter now came out at the front of the car while 440 came out of the rear, where the the main unit was. This avoided confusion I had previously run into over which band I was hearing. The problem began when the audio started suffering from feedback oscillation and

microphonic sensitivity to vibration on the 440 side. Vibration, or strong signals would set the thing into a loud hum. I tried to switch the extension speaker to the 440 side to see if the 2-meter side would oscillate, but when I did this, both 2-meter and 440 came out of the speaker, but not both at the same time, ie if I would be listening to one band, and the other band broke squelch, it would turn off the first (forget which had presidence). I could not get it into a mode with 440 coming out of the extension speaker and 2-meter out the base unit. When I bought a second extension speaker, everything worked OK, ie one band out of each speaker, and no oscillation out of either band. Very strange.

Overall, even with the strange behavior, I would still buy the 599, it is basically a nice unit. I would be curious whether other 599 owners have observed the same problems.

In article <1992Oct9.145626.4685@miki.pictel.com>, wpns@miki.pictel.com (Willie Smith) writes:
> [... in response to a posting on the arrogant attitude of some radio stores' sales droids...]
>
> The late great totally unlamented Tel-Com in Littleton Mass used to be that way, but for some strange reason they went out of business. :+) I lived less than 10 minutes away, but would happily drive to HRO in New Hampshire to buy the latest repeater directory rather than be abused at Tel-Com. Seems they just couldn't compete. :+)
>

I don't think I would have minded the attitudes of the folks at Tel-Com quite so much if the place hadn't absolutely REEKED of cigarette smoke! Being ignored is bad enough; being ignored when you want DESPARATELY to get out the door before you GAG from the stench is quite another matter. It got to a point where, if we decided to go up there for something, I'd send Dan in; when he came out, we'd leave the windows open all the way home to air him out, because he (and everything he bought) generally stank of stale cigarettes after spending 5 minutes in their shop.

When Tel-Com went out of business, HRO in Salem, NH bought out some of their small parts and put them on display up in their shop. I could always tell which were the Tel-Com parts, just by smelling the packaging. Gack!

I'm starting to be rather wishy-washy about going into Rivendell Electronics in Derry, NH lately, too, because Noel and/or Pete seem to smoke on the job. It's a major-league turnoff for me... (and yes, I'm responsible for the no-smoking rule at one of the local club's meetings; I'm pretty close to doing the same for the other club we belong to, too). Noel is not the arrogant type, and is generally pretty helpful, but as far as I'm concerned he'd probably do lots better business if he'd outlaw smoking in the shop.

The guys at HRO in Salem, bless their souls, do not smoke on the job (or if they do, they do it where it doesn't pollute the air of the shop), and have never been anything less than very helpful to us, even back when we weren't on a first-name basis with them all! :-) (hi Gene!)

3521. Scanner Cellular Ban becomes law (NY Times bad mouths hams too)

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-09 18:53:27 UTC
From: whs70@dancer.uucp
Message-ID: <1992Oct9.185327.14620@porthos.cc.bellcore.com>
Source record: 284557

The bill (section 9 of an FCC funding bill I think) that bans the
manufacture or importation of radio scanners that can eavesdrop on
cellular telephones was passed by both houses of congress and signed
by the President. This according to the 10/9 New York Times.

So, guess this should make any existing scanner go up a few bucks on the
resale market :-)

In the mean time all those unsuspecting (ie. stupid) people will now
think they have privacy. What a joke.

As Robert Grove, publisher of "Monitoring Times" was quoted, "all
it (the law) will probably do is stimulate the market for add-on
frequency converters" that restore cellular listening capabilities.

In contrast, John Rosch, chairman of Radio Shack said "the
legislation will be simple and inexpensive fpr Tandy to comply with.
It's positive legislation."

Oh yes, and how does the NY Times view the amateur radio operator?
I quote from the story by Anthony Ramirez, "Such eavesdropping (of
cellular telephones) an increasingly popular pastime among possibly
millions of HAM RADIO OPERATORS (my emphasis in capitals) and
other hobbyists, has unnerved cellular customers and outraged privacy
advocates."

The story appears on page D3 of today's Times (10/9/92).

3522. Jamboree on the Air

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-09 18:57:15 UTC
From: w1gd@cbnewsj.cb.att.com
Message-ID: <1992Oct9.185715.6170@cbnewsj.cb.att.com>
Source record: 284552

N2HYG and I are going to be operating JOTA on Saturday, October 17th from Allaire State Park in Wall, NJ. We will be with Troop 163 from Brick and Cub Scout Packs 163 from Brick and 333 from Wall. I hope to have my station on from 1 pm to 9:30 pm. This is the third year I've operated with this group and it's really fun. There will be around 40 scouts and 10-20 adults. It's a great chance to show off ham radio. Because of the length of time we want to be on the air, I really need some help. I'm looking for a few operators to come over and spend an hour or so. Duties will be mainly to make sure the scouts follow FCC rules, don't destroy my equipment (:-))and answer their questions. This is really a great group of guys - really enthusiastic and well behaved. Please consider coming down and helping. I can be reached at 908-681-9124 (Home) and 908-949-9511 (Work) or at hogpa!gjk.

Tnx.

Gerry Kersus, W1GD

3524. Re: Need help with relay driver circuit

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-09 19:00:49 UTC
From: kharstin@MtHolyoke.edu
Message-ID: <BvvBHG.IyC@mtholyoke.edu>
Source record: 284549
Cross-posted to: rec.radio.amateur.misc,sci.electronics

You may already have done this, but a relay driver must contend with the EMF of the coil when the driver attempts to open the circuit. There are a couple of ways to get around this. One is to put a diode reverse biased and in parallel with the relay coil. The other is to place a small capacitor in parallel with the relay coil.

When the coil has current going through it energy is stored in the core. When the current is broken the energy in the coil must be dispated. The way most of the core energy is disapated is by inducing current in the coil. This current will flow untill the energy is disapated by some external component. In this case the transistor. The voltage will rise to whatever level is required to induce current. This can be kilovolts. The transistor will breakdown and allow the current to flow. Sometimes the transistor will survive this breakdown, other times it will not.

The use of a reverse biased diode, or capacitor will disapate this energy harmlessly at at a low voltage. The level of the energy is quite low.

I'm looking for a multifunction generator, 13.8 volts rms with a current capability of 20-22 amps. Anyone have one to sell??

Well, if it is such a popular request, doesn't that indicate a
significant amount of interest in such a project?

I am sure that the vast majority of those who read about QRP
transmitters do not actually build them. It has been expressed here
(during the thread/flamewar about QRP rigs) that many do not have any
interest in building a QRP rig but is interested in the techniques
involved.

>so I've been busy working on
>stuff I consider more interesting to me. I figure that if I'm
>going to spend a lot of time developing an easily duplicatable
>project, it might as well be with something people are actually
>going to build.

Fair enough. Everybody should work on things which are interesting to
them.

3529. Low audio prob on IC-2SRA Tx

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-09 19:50:34 UTC
From: srm@world.std.com
Message-ID: <BvvDsB.6A3@world.std.com>
Source record: 284562

I have a brand new IC-2SRA. Receive seems okay, but all my
contacts report I have low transmit audio. Some have said this
is a common problem with Icom units. Can I reasonably increase the
deviation myself? What have others done?

Distance. You have a limited amount of power. You want as much as possible
of it to travel parallel to the ground rather than upward into the sky.

Hitting repeaters is non-trivial if you're using relatively low power
and the repeater is a few miles away on a short tower.

*----
Too bad - it really seemed like such a nice operation. If you're
pissed off enough, please write to the Commercial Exhibits Chairman
for the Dayton Hamvention (and Indianapolis, where he exhibited).
It might give you some satisfaction if they can't exhibit next year.
On the other hand, Dayton doesn't seem to care about anyting but the
money they get. Max Systems WAS selling what appeared to be
factory-new (and reconditioned, clearly marked) Matsushita drives
at Dayton, and unfortunately, the circumstances you detail here
make it look like they're intentionally ripping off the unwary.
All of my dealings with them were cash-and-carry, so I got what
I paid for.

Tom-Tech Enterprises in Ashtabula, Oh. has some good deals on
CD-ROM drives, and gives very good mail order service. They also
exhibit at hamfests.

>I don't understand it... you gave a substantial amount of money to a stranger
>in return for their promise they would quickly ship you a product they didn't
>have at the time?
****
As you said, you don't understand. This was a COMMERCIAL ENTERPRISE, not
a flea-market exhibitor. You depend on the good faith of ANY store to
deliver the merchandise that was promised. A lot of stores require a
deposit for special-order or specially priced merchandise.

>On the other hand, the 'Smart Shopper' would;

>1.) Purchase via Credit card.
> You can return ANYTHING within 30 days and pay nothing. All you need
> do is call your credit card company, indicate that you are 'unsatisfied'
> with your purchase. Then ship the offending item back to the vendor, get
> a shipping receipt (insure the package optionaly, I send it back COD)
> and mail a copy of the purchase and return shipping receipt, VOILA!
*----
I don't think this is correct. First, the federal laws apparently cover
you if you purchase mail order from somebody over 150 miles away. I don't
believe you are guaranteed the same protection under other circumstances.
As for the credit card giving you special 30 day return privileges, that
is absolutely incorrect. You are covered if you don't get the merchandise
that was promised, or if it was somehow defective and the store refused
to satisfy you. But there's no automatic right to return anything for
full credit.

> Your account is credited the FULL amount of purchase.
*----
What world do you live in? This might happen IF you dispute the
charge and IF the credit card company decides in your favor. This
does not always happen. And credit card companies recognize the
right to charge a restocking fee if you return the merchandise
for reasons other than misrepresentation or defects.

> This is federal law. This is why direct marketing (mail order) ALWAYS
> offers '30 days satisfaction guarantee!' It's Federal Credit Law. Might
> as well offer it as a feature. Some offer an additional 30 days, but
> impose restocking fees during this period.
*----
30-day satisfaction (that the product performs to specifications) is not
the same as a 30-day absolute return policy. Your interpretation of
the law doesn't agree with my credit card provider's interpretation.

>Common sense will avoid these sad stories as we've read here. Protect

*----
I didn't see any lack of common sense in what D'Armond did. Keep in
mind that many computer suppliers operate on a very tight margin, and
keep costs down by accepting personal checks, while charging 3%-5%
overhead on credit card purchases. This was a commercial exhibitor
that had already developed something of a (good) reputation. To me,
it proves that no matter how much common sense you use, you can
still get ripped off.

3534. Sony PYXIS GPS receiver?

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-09 20:52:25 UTC
From: JIMKIRK@corral.uwyo.EDU
Message-ID: <4126451409101992.A17707.POSSE.116A4BAB1000*@mrgate.uwyo.edu>
Source record: 284561

I note in the latest EEB catalog the Sony GPS receiver, the IPS-360 PYXIS, is now available. For only $995 you can find out where you are :-)

Does anybody have any experience/reviews of this unit to share?

Jim Kirkpatrick, jimkirk@corral.uwyo.edu WB7BUP

>fully-automatic, unattended operation on the IARU "packet priority" sub-
>bands and semiautomatic operation in all digital sub-bands.

A welcome change of heart. Doubtless there will be vocal opposition from those who currently inhabit those subbands -- CW and RTTY hounds -- but operations should adapt to the WARC bands quite nicely.

3536. AURORA WATCH: Middle Latitude Auroral Activity Watch

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-09 21:07:30 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.718664850@honte>
Source record: 284570
Cross-posted to: sci.astro,sci.geo.meteorology,rec.radio.amateur.misc,rec.radio.shortwave

/\

MIDDLE LATITUDE AURORAL ACTIVITY WATCH

ISSUED: 20:45 UT, 09 OCTOBER

/\

VALID UNTIL: 19:00 UTC ON 11 OCTOBER

MODERATE RISK PERIOD: 09 - 10 OCTOBER (UT days)

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: LOW TO MODERATE

POTENTIAL LUNAR INTERFERENCE: HIGH

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: FAIR - POOR

AURORAL ACTIVITY MAY BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

SOUTHERN BRITISH COLUMBIA TO MONTANA TO NORTH DAKOTA AND POSSIBLY
PARTS OF SOUTH DAKOTA TO MINNESOTA TO WISCONSIN TO MICHIGAN TO
NORTHERN NEW YORK STATE TO SOUTHERN MAINE.

SYNOPSIS...

Auroral activity has become enhanced over the last 24 hours due to the
arrival of two minor interplanetary disturbances. Activity is expected
to remain modestly enhanced over the next 24 to 48 hours. Conditions
may become sporadically favorable for observations of activity over the
middle latitudes during the local evening and early morning hours of
09/10 October. Lunar phase will inhibit the visibility of activity.
This is not expected to be a particularly impressive period of auroral
activity.

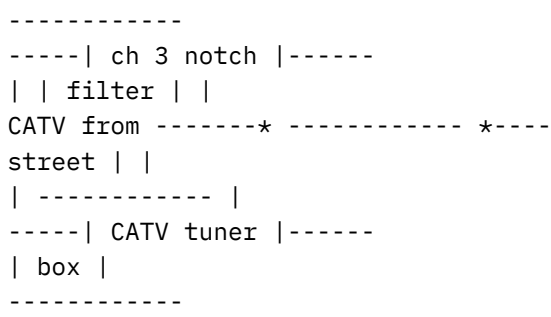
This WATCH will remain active until 19:00 UT on 11 October when it
will either be updated or allowed to expire.

** End of Watch **

3537. Will this work?

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-09 21:36:49 UTC
From: elmquist@pez.ssesco.com
Message-ID: <BvvIpE.9t5@ssesco.com>
Source record: 284560
Cross-posted to: rec.video.cable-tv,sci.electronics,rec.radio.amateur.misc

I'd like to build this filter/combiner circuit to eliminate A/B switching
ahead of a cable ready TV...



*= two port splitter/combiner

The CATV tuner box is supplied by the Cable Co. and is required to decode
scrambled programming. I want to be able to tune the TV (with its remote
control) or VCR (with its timer) through all of the none-premium cable
channels and then tune to channel 3 (which is the output of the CATV tuner
box) to watch premium programming. Obviously, the right-most splitter
in the above drawing could be followed by a distribution amplifier to
drive multiple sets.

I am wondering if the output of the tuner box is much wider (in frequency)
than just channel 3... will I need a really wide notch in order to kill
all of its output ? Perhaps several filters would be needed in series
to completely kill the channel 3 from the street ? Would the channel 2
and channel 4 from the street bleed over into the channel 3 output from
the tuner box ?

Has anyone done this or know of an off-the-shelf solution to this apparently
simple (and annoying) problem...

Chris

Source record: 284391

In article <9210011332.aa18329@Paris.ics.uci.edu> turner@safety.ICS.UCI.EDU (Clark Savage Turner WA3JPG) writes:

My question is: during a charge, does a lead-acid cell such as this emit any dangerous fumes? I will trickle charge with no special circuit, using a 3 amp supply on occasion for a day or two just to keep it up. I want it to be near full charge at any given point. I plan to use the battery once a month to operate for a few hours (test and recharge).

Clark

This question is well answered by many others, but one safety concern hasn't been mentioned. I work in the telephone industry, where everything is running off of central batteries. One of the biggest hazards I have seen is that batteries are capable of providing incredibly high currents. I apologize in advance if you've already thought of this.

For your protection, and that of your equipment, insure that the battery terminals are not left exposed (the boat battery case mentioned previously would be perfect for this). A dropped tool would make quite a mess if it shorted the battery. Also, I would install a fuse as close to the battery as I could. This will protect everything down stream from the battery, especially any power distribution wiring.

Speaking of wiring, remember that the resistance of the wire will be significant for that low of a voltage. Keep your runs short, and use the largest wire size you possibly can. You mention 40 meter DX as one of your goals for the battery. Unless you are running QRP, you're going to need some big wiring. There have been articles before on power wiring for cars, and many of the same rules apply. In our lab here, the smallest size wire we use for the -48v distribution is 4/0. If you keep the battery close to the radio I doubt you would need this, but I would consider going no smaller than 4 gauge for anything over 2 or 3 feet in length. My off-the-cuff design would be to run 4/0 to 4 gauge (depending on distance and total load) from the fuse at the battery to a multiple fuse panel at the radio(s). Then use 8 gauge (larger for big amps, smaller would be ok for low power rigs) from each individual fuse to the radio(s).

For a quick and dirty source of large gauge wire, consider disassembling a set of car jumper cables. Also, welding cable would be quite suitable, and available in short lengths.
- Dave

3540. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-09 23:19:29 UTC
From: tkelso@afit.af.mil
Message-ID: <1992Oct9.231929.17056@afit.af.mil>
Source record: 284572

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.misc. This week's elements are provided below.

NOTE: We have been having some problems this week with the availability of the two-line element sets due to an exercise of the Alternate Space Surveillance Center (ASSC) at NAVSPASUR (Naval Space Surveillance Center). Data flow should return to normal next week when processing returns to the SSC at NORAD.

|>
|> Thanks for any info
|>

My comments are based on the 2 radios in our family, and a friend's radio.
I wrote a response to QST about the comment on the weak battery connection
and I believe we agreed to disagree, on very friendly terms though. All are
DJF1T's bought in the last 12 months.

My radio has been dropped about a dozen times. It also fell out of my
bike bag once and was drug by the coax attached to the antenna connector
for about 50 yards starting at about 15 mph. The case is gouged and
scratched, including some good dings in the battery. The radio works
fine. My wife drops her radio so much I put a soft case on the unit
to protect if from scratches. Of the 3 radios I am familiar with, none
of them have experienced a failure. I consider the radio as tough
as any on the market and think I have empirical data to back it up.
The QST reviewers dropped the radio 3 feet and the battery broke off.
I'm not sure why there is such a vast difference in our experience.

The disadvantages to the battery attaching to the back of the radio
are that #1 you need a belt clip for every battery and they don't come
with the spare batteries, and #2 the radio heats up a lot because the
heatsink for the final is up against the battery where it can't dissipate.
I have run my radio for several hours at 5 watts in a bike bag with
no ventilation. It doesn't seem to mind, it is just very warm to the
touch. The radio does have a built in thermal sensor that decreases
power before it will damge the final.

My only complaints about the radio are:

* It gets beat up a lot by intermod. This seems to be common though
in wide band tiny HT's.

* The "MONI" function is brain dead. It is supposed to apply a repeater
offset and open squelch so you can "Monitor Input" to a repeater and
see if simplex is possible. None of Alinco's HTs do this. I guess they
don't spend enough time playing with ICOM, Kenwood, and Yaesu before they
build the clone.:-)

* The DTMF pad gets disabled if you use the handy remote mike that lets you change frequencies. The remote mic and DTMF are mutually exclusive which is kind of a pain. I would not recommend buying the remote mic, but get the regular mic.

Given these few problems and all of the features you get for your money I highly recommend this radio to anyone wanting a small HT.

Have you all noticed how HOSTILE folks are getting lately?
First of all, (sic) is used when you are quoting someone, and you know
that the quote contains an error - you point out by using (sic) that
you are aware of the error and are allowing it to be included so that
the quote is accurate.
The original poster said "MATSHITA" which is not in error. The fact
that you assumed it was an error and meant to be MATSUSHITA is
YOUR PROBLEM.

Only you, fella, only you. Best thing to do when reading my posts is
to assume I write exactly what I mean. BTW, "SIC" would have only
applied had I been noting a misspelling by someone else. Such
as your use of "labelling" (sic) above.

Center to center should be fine, but note below.

>Now that I think of it, I could also finesse the problem by figuring
>out the lengths by experimentation. I could put the 1/4 wave section in
>line with the center conductor of a feed line to an antenna and null
>the reception of a signal by varying the length of the stub. The deepest
>null would provide the correct length.

This is the best, though tedious, method. You only have to do it once, then you can just duplicate that item for the other stubs. A tip, however, use telescoping tubing rather than cut to fit. You *will* cut too much trying to find the deepest null and butt soldering copper pipe is no fun. These "trombone" sections are a standard tuning and matching tool at VHF/UHF, you should have several lying around anyway. So don't feel bad about wasting material, look at it as building useful test equipment.

Your suspicion is exactly right. You are getting RF back into the keying circuit. That RF is being rectified by the keying transistor junction and series diodes and is holding the transistor energized. The solution is rather simple. Use shielded cable between the *metal* cabinet of the keying adapter and the radio, use a choke and bypass capacitor in the keying line where it enters the adapter cabinet, and place a leadless bypass capacitor between the keying transistor base and emitter.

>in AX.25 style (or any carrier sense multiple access) operation.

This is exactly the section of the 30 meter band *currently* being used by the STA stations. It's consistently been the most useful band during the STA period. A casual listening survey of the band indicates that there are *currently* more packet signals in this small segment than there are CW signals in the entire 30 meter band. I think you protest too much.

>> 160M: 1.810 - 1.820 MH
>>
>
>Whoa!! This is just about the hub of cw activity on this band. Of my
>last 10 cw contacts on this band, eight are in this segment. In my mind
>this is like requesting 50Kcs in the 28.3 to 28.5 band.

No, it's like requesting 10 kHz in the 28.1 to 28.3 MHz band. In fact, the request on 10 meters is for 69 kHz in that segment. There's already a unique 10 kHz of DX window on 160, another small window in a sparsely populated band is not excessive. You still have 40 kHz of CW *exclusive* bandwidth, something no other amateur band shares, and 150 kHz of mixed mode space. Buy another crystal for crying out loud.

3557. Car antenna design help wanted

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-10 14:05:35 UTC
From: richard@ee.byu.edu

I would like to design a better antenna system for my FM tuner
in my car. Does anyone know of a good book that could help me?
I am aware of many books dealing with antenna theory, but not with
the problems of mobile antennas. I want to get a matched,
at least as matched as possible, system, ie. baluns, impedance
transformers, matched pre-amp. etc. For instance, the way that
most antennae are connected to with a coax. Doesn't this make
large reflection of the signal? I would assume that the dipole
is tuned to 300-377 ohms and the coax is 75-50 ohms.

Sorry for babbling.
Any help would be greatly appreciated.

The rig is specified at 10 amps draw at 13.8 volts during transmit.
I would suggest that it's poor practice to try to draw that much
current through a cigarette lighter adapter. The lighter only
draws about 2.5 amps after the initial surge, and the wiring is
sized to accomodate that level of steady current draw. My Alinco
590 gets squirrelly at a supply voltage of 10.5 volts, which is
fairly normal for 12 volt equipment since it equals the fully
discharged terminal voltage of a 12 volt lead acid battery.
I suspect your 599 behaves the same way, and that the terminal
voltage out of the cigarette lighter drops to that value under
heavy load. This isn't a radio fault, it's an installation
fault.

3561. Attaching A Vertical To My House

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-10 15:06:02 UTC
From: johnr@mik.uky.edu
Message-ID: <johnr.718729562@mik.uky.edu>
Source record: 284434

I am interested in purchasing a dual band (144/440Mhz) antenna to mount on my house, but am at a loss about trying to figure out how to attach it to my house. First I would like to know if the cable that I currently own (from a previous non-ham related project) will work for this antenna. Here is what the side of the cable says:

BELDEN M 9058 DUOBOND PLUS RG-6 TYPE 75 OHM E86432 (UL) CATV --- LL85170 CXC FTI QP

I have no idea what this means, but I do have about a hundred feet of it and would like to use it if it is at all possible.

To mount the antenna to the house I am planning on using parts from Radio Shack unless someone would like to recommend a better source. I am looking at their 1993 catalog on page 100 and am wondering if the mount which attachs to the eaves (figure 7) would be very sturdy. It attaches to the eave in three places. If anyone sees any of the other attachments in the catalog or anywhere else that you think may be better please suggest them. Also, one point about the attachments which are nailed or screwed through the shingles: how do you prevent the holes from leaking.

I really do appreciate the help that this group has offered to me thus far. Hopefully in the next few weeks when someone else asks these questions I will be able to help them. Thanks for your advice and support!

C'mon John, lighten up a little. First thing I thought when I saw your post was "This guy doesn't know that Panasonic = Matsushita (many people don't, really), and he's made a simple typo." Looks like a lot of other ordinary people thought that too. If your schoolmarm-English won't let you use 'sic' in this context (can't see any problem with it myself, it's just a Latin abbreviation for "yes, it should read like this"), you could have put "Matshita (_not_ Matsushita!)".

And what's with this anti-UK stuff? I'm Australian. Let's get back to what Usenet's supposed to be for, and stop jumping down each others' throats.

3565. gb2rs news 11th october 1992

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-10 17:23:44 UTC
From: ted@tedb.demon.co.uk
Message-ID: <718755000snx@tedb.demon.co.uk>
Source record: 284444

Good morning. It's Sunday the 11th of October and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

This week we have news of the Funeral of "Dud" Charman, G6CJ; a New Council Member for Zone C; appointment of an Honorary Officer, some Special Jamboree on the Air stations, microwave enthusiasts; plus all the usual DX, contest, rally, propagation and club news.

With the death and funeral of Frederick J. H. (Dud) Charman, BEM, G6CJ, the Society and the Amateur Radio movement have lost a unique character, who contributed greatly to the hobby in the early and in-between years. Council Member John Forward, G3HTA attended the funeral on behalf of the Radio Society of Great Britain. A full obituary on the life and work of Dud Charman, G6CJ will appear soon in Radio Communication.

At the RSGB's Council Meeting held last month the decision that Neil Lasher, G6HIU, be invited by Council to be a co-opted member for Zone C under Article 27 of the Articles of Association was agreed. This took effect from the 25th of September.

News now of the appointment of John Irving, G4XJT as the Honorary Officer for the position of Emergency Communications Officer. He will take up the position with immediate effect, but for the moment all communication is to be passed via the Chairman of the RSGB Membership Liaison Committee, Clive Trotman, GW4YKL, whose address is correct in the RSGB Call Book. Further details of the address and telephone number for John Irving will be released as soon as they become available.

Next weekend is the 35th Scout Jamboree on the Air, which this year has the theme " Let's Talk". Last minute details and information about the event can be obtained by telephoning the JOTA hotline on 071 581 9920 from Monday the 12th of October onwards. Special stations that will be taking part this year include GB2TWB Tower World Blackpool, at the top of Blackpool Tower and GB2BT at the top of BT Tower, London. This is part of a link-up between Scouts at Towers around the world which are members of the World Federation of Great Towers. Please remember that the aim of the event is to enable Scouts and Guides to talk to and find out about each other. They should be given every encouragement to do this within the rules of the licence.

The next RSGB Microwave Round Table meeting has been arranged for Sunday the 18th of October. This meeting is the scheduled Autumn event of the Southern series.The venue is the Flight Refuelling Amateur Radio Society Club, Wimborne, Dorset, which is signposted from the Wimborne by-pass. The meeting will start between 10.00 and 10.30am. It will feature an open forum; items under construction and complete stations; a bring and buy sale; a calibration and alignment session, and a short presentation. Further details can be

obtained by telephoning Ted Jewell, G4ELM, on 0730 892462

Now for some repeater news;

We apologise to the GB3DS Repeater group who were incorrectly listed in the October RadCom article on repeaters as having completed the documentation but not paid the franchise. The payment was received by the accounts section at RSGB Headquarters in June but was not notified to the repeater person for issue of the franchise letter.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Canada, the Listowel District Secondary School Amateur Radio Club will sign as VD325E from Saturday the 17th until Friday the 30th of October. This to celebrate the 25th anniversary of Elma Township Public School. From Fernando de Noronha, PP1CZ will sign PY0F/PP1CZ from Saturday the 17th until Saturday the 31st of October. From Antigua, JP1NWZ and JL1MUT will sign V2/home call from 21st to the 28th of October. They will be active on 160 to 10 metre bands including the WARC, using CW and SSB. From Ascension Island, N6TJ will be active as ZD8Z from Tuesday the 13th to Wednesday the 28th of October.

Rally news now, and we know of three events for today Sunday the 11th.

The Armagh and Dungannon and District Amateur Radio Society Rally is being held at the Gosford House Hotel, Markethill, County Armagh. Doors open at 12.00 noon. The event features the usual traders, a bring and buy and refreshments will be available. Talk-in is on channel S22. The Hornsea Amateur Radio Club Rally is being held at the Floral Hall, Hornsea, North Humberside. Doors open at 11am, 10.30am for disabled visitors. The event features trade stands, a bring and buy. The South Devon Radio Club's 'Computercation 92' Computer and Radio Rally is being held at the Hillhead Camp Site, Dartmouth Road, Brixham, Devon. Doors open at 10.00am and the event features trade stands, car boot sale and refreshments. Talk-in will be on channel S22 via GB4CPU. There are no scheduled rally events that we know of for next weekend Saturday the 17th and Sunday the 18th of October.

HF Contest news now:

During today Sunday the 11th, the RSGB's 21/28MHz Telephony Contest is taking place from 0700 until 1900GMT. During next Sunday the 18th the RSGB's 21MHz CW Contest will take place between 0700 and 1900GMT. See April RadCom page 66 for further details.

Next the VHF/UHF Contest news:

The next RSGB UHF event is the 432MHz Cumulatives for Wednesday the 14th of October. It runs from 1930 to 2200GMT. This is the first of five to be held in the next three months. See June RadCom page 65 for further details. The next RSGB VHF event is the 144MHz CW Cumulative for Friday the 16th of October. It runs from 1930 to 2200GMT and June RadCom has further details.

Special events

During next weekend the Scottish Tourist Board Radio Amateur Expedition Group, will use the callsign GB2STB from Airdrie Town Hall, Airdrie.This is to mark the Launch of Airdrie Mod 93, the 101st International Gaelic Festival. All the Special Event locations operated from by the Group are open to the Public. Contact with the stations taking part will count towards a Certificate and Trophies Awards. For further information contact GM3MTH, by telephoning 0236 440495

And now the solar factual data:

The period 28th September to the 4th October saw considerable magnetic disturbance due to the passage of a coronal hole, there was no flare activity. Very poor ionospheric conditions resulted and were only just recovering by the time this bulletin was being prepared. Sun spot counts meaned at 136 though they ranged from 93 up to 179 over the period. Solar flux levels averaged 118 units and did not vary much day to day. The geomagnetic Ap indices reached magstorm levels at Wingst on the 28th at 12.03 GMT, and by the 29th storm levels of Ap 57 units were recorded. Conditions remained very unsettled up to the 2nd October, when the levels then declined to quiet. The period averaged 22.7 units. The state has been no flares and no protons just a magnetic storm. There was a classic pre auroral enhancement of the HF bands leading up to the 28th, then the radio quality indices collapsed to extremely low levels on all circuits by the 29th, and were only beginning to improve by the 4th. The aa indices as supplied by the British Geological Survey for the period 22nd to 28th September were quiet, with the daily averages for the period being 17.5 nanoTeslas only equal to K3. The mean sunspot count for September was 62.9 with the maximum of 86 on the 24th and 27th. and the minimum of 38 on the 8th. The smoothed count for March 1992 is 108 +/- 5, with the forecast for September 1992 being 94 +/- 15. The Orionids meteor shower starts October 16th but reaches its peak on the 22nd.

Now the ionospheric data for England and Wales:

The F2 daytime critical frequencies at Slough as reported by Appleton averaged 7.3MHz but dropped to only 5.5MHz on the 29th, and though levels were recovering by the 4th October, only 7.7MHz was recorded. The darkness hour lows averaged 2.1MHz and did not vary much day to day, with the low levels now being around 05.00 hours most days.

Now the ionospheric data for the north:

The F2 critical frequencies are not available from Irkutsk any more, so we will be using the Sverdlodvsk:- (pronounced SVAIRD-LOVSK) :- data which is situated at North 56 and east 61 degrees, The daytime levels averaged 6.8MHz and the darkness hour lows 2.4MHz. With satellites and fibre optic cables, taking over communication circuits, interest in the ionosphere is now very low. One reason why observatories like Irkutsk are dropping out. Its only amateurs and shortwave broadcasters that are interested in the ionosphere these days.

And lastly the solar forecast:

This week, the quiet side of the sun will be coming into view, solar flux levels are expected to be about the 110s. Magnetic activity is expected to be

quiet. Ionospheric MUFs during daylight are expected to reach 24MHz, though conditions could improve towards the end of the week when 28MHz may be open for north/south paths. The darkness hours are expected to reach 18MHz, with 14MHz being best for east/west contacts.

And that's the end of the solar information.

Finally in the main news, the licence issuing agency, SSL, has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S M and G7 N T series, and Novice calls in the 2 0 A D
and 2 1 B C series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

>>
>>BTW I did finish the A&A, Oakhills Research, Tejas RF Technology,

Hi,
I will give you my short review of the Oakhills Research 20m QRP tranceiver....

I built Oakhills 20m qrp transceiver. I ordered the unit by telephone. The proprietor answered the phone, was very nice and informative, and I got my unit by UPS about 1 week later. The unit arrived complete, the chassis was made by TenTec, and was nicely painted, and labeled. All of the holes lined up properly. There was a little difficulty in mounting the VFO tuning capacitor.

The printed circuit was a bit of a challenge to build. It was a single sided G-10 fiberglass board which was solder plated and reflowed, but had no soldermask, or component location silkscreen. The assembly technique was basically: "place all of the resistors, capacitors, transistors and coils, solder carefully, use the partslist, and the pc board drawing as a guide..." There were 13 jumpers on the board. All were on the component side of the board, and all are fairly long, so as to clear the tops of the components. The jumpers were used to route the +12v to the various parts of the circuit. The instructions for the jumpers were something like: "cut the jumpers to the lengths in the table, and connect jumpers to the holes marked with the same letters (g. A->A, B->B...). Route the wires clear of the tops of the components.

The receiver is a fairly simple single conversion superhet design with a 9MHz IF, and a 5-5.1MHz VFO. The antenna is fed thru a band pass filter into a NE602 Mixer chip. This in turn feeds a crystal ladder type filter using 4 selected 9MHz crystals. The IF uses a MC1350 IF chip, and the product detector is another NE602 Mixer chip. The BFO uses a 9MHz crystal controlled oscillator. The detector is then selectably passed thru a 2-stage narrow band audio filter, or directly into a constant gain LM386 which also doubles as an audio derived AGC circuit. Volume control is done by a 1K pot from the LM386 output to gnd with the 8 ohm phones connected between the wiper and ground. This method of volume control works terribly!

The transmitter is also very simple. It is done by mixing the VFO with a 9MHz xtal oscillator using a MC1496, and feeding a selected 2n2222A

that drives a 2SC1909 final transistor. This arrangement gives about 3 watts of output when powered by 13.6 volts. The transmitter sidetone is generated by a multivibrator, and is rather harsh and is adjustible by an internal trimmer, and the volume control. It is hard to reach a compromise in these settings, as a sidetone that is ok for loud signals is too loud for weak signals. The transmit relay is controlled by a retriggerable oneshot circuit and responds quickly to the first key closure, and has a fixed hang time of about 1/2 second. This provides a semi-full QSK type of operation.

The VFO uses a toroid as its main tuned circuit, and the lower end frequency of the VFO is set by compressing the turns of this coil. This is very difficult, and it was impossible for me to make the dial markings match up with reality. The VFO drifts intolerably for the first 30 minutes of operation, then settles down to an acceptable amount of drift.

The lab tests that I did on the unit were somewhat problematic. The receiver easily met its .25uv MDS (with audio filter in), and its selectivity was about 1KHz without the audio filter, and about 200Hz with the audio filter. When running without the filter, the signal was generally rather deep into the receiver's internally generated hiss. With the filter, tuning was fast, but the hiss was virtually nonexistant. I only run with the filter on. The transmitter was where I had some difficulties.

In testing the transmitter, I found two fairly strong spurs, one was about 1MHz above the carrier, the other was about 1MHz below. These spurs were at -35dBc, and weren't affected by alignment. The third harmonic was at -40dbc The FCC requires ham transmitters in this power level to have all spurious emissions less than -35dbc I am not confident enough about the accuracy of my spectrum analyzer to swear that this transmitter meets these specs. (this is because my Ailtec 707 is rated at +/- 1db)

Operation is fairly comfortable. If the signal is very loud in the receiver, the other side might be just able to hear you. The volume control is the worst feature. The difference between acceptable loudness, and ear shattering loud is about 1 degree of rotation! The AGC works pretty well, but the threshold should probably be set lower then specified (you can set it with a trimmer) If you are planning on running this thing on batteries, pay close attention to its need for a long warmup. If you are going to use it in your home, just leave it on all the time. I guess you will have to make your own decision as to whether this beast is legal to transmit with. I decided it was ok for me, because its spurs are really in the flea power range (~10E-3 watts) and probably won't travel too far (gee, wasn't that the point of playing with QRP?).

73,

The author of RBB826.exe claims that this program can be used as a straight RTTY Terminal. It is basically an RTTY BBS Program in self-extractible form and may be downloaded from The HAM Connection Server at 409-833-1795. The name to download is rbb826.exe from the main HAM Conference.

By default, I have become the president of RAMS (Radio AmateurS of Marquette). The organization (W9ODD) has been strong in the past but now there are two members and an advisor. We have an operating repeater (147.21+ for locals) and such. The problem is: We cannot find members! I would like help from folks on good ways of finding people. Also, I will be making a poster for a meeting; can anyone suggest catchy things to get people interested?

Thanks...

73 de N9LEA President, RAMS (W9ODD) Marquette U., Milwaukee

=========
SpaceNews
=========

MONDAY OCTOBER 12, 1992

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* UNAMSAT-1 NEWS *
==================
UNAMSAT-1, a microsat built by the Autonomous University of Mexico, could
could be aloft via a piggy back launch on a CIS Russian Metsat in December.
What is most interesting about this project is not its microsat digital store
and forward capability, which is of the 1980's FSK up, PSK down type, but,
its supplementary module featuring a 40 MHz meteor radar.

This meteor radar is a highly ambitious departure. We know (from IRAS,
and the Euro, Russian, Japanese comet probes) that most meteor trails
are caused by comet dust colliding with the Earth's upper atmosphere.
Anyone who listened to the recent Perseids around 1900 UTC on 11-Aug-92
will know the doppler shift on some meteor echoes can be very pronounced.
Doppler can tell us in an indirect way, the minimum speed at which the
comet dust/meteor was travelling as it hit the ionosphere. In this way we
may be able to get a good answer to a question which has interested Comet
Watchers for centuries: "Do all comets coming around the Sun at perihelion
originate in our Solar System?".

The general theory that comets are formed in the outer "frozen" edges of
our solar system and perhaps other star systems, calls for disturbance of
this edge of system comets, which now and then sends them tumbling
inwards around the center of their star/solar system, or conversely
causes them to leave their star/solar system and perhaps eventually
enter a different star/solar system.

In theory, any comet whose orbit is parabolic or hyperbolic (as opposed to
the closed elliptical orbit of say, Comet Halley), could be a stray from a
star system other than our own. But, orbit determination when eccentricity
is near 1 or greater is notoriously difficult to obtain. However, if we get
meteor reflections whose doppler indicates a meteor velocity greater than
the escape velocity from our solar system, then we may just possibly be
able to suggest that it might have of extra-solar origin. Hence the

attraction of UNAMSAT-1 which will use DSP techniques and report received meteor trail echos to Earth by AX25 telemetry.

Please note in addition that one does not need to be a G3IOR, to see two other possible features of this exciting experiment.

1. You will probably be able to "Ping steal" on this meteor radar, i.e. trigger your scope time base on the pulse transmitted by the satellite, then watch the scope trace for echoes (your own private meteor radar!).

2. You will be able to use the 40 MHz pulses from UNAMSAT as a super downward sounding probe of the ionosphere, at all angles of penetration of the ionosphere.

So whether you want another store and forward bird, or a stunningly original experiment, UNAMSAT-1 should have what you're looking for.

[Info from "Satgen 180" by GM4IHJ 05-Sep-92]

* FO-20 NEWS *
==============
A software reload was completed on 30-Sep-92 at 12:42 UTC, and Mode JD operation was resumed.

The latest Mode JA analog transponder schedule follows:

14-Oct-92 00:51 UTC -to- 15-Oct-92 01:10 UTC
21-Oct-92 01:15 UTC -to- 22-Oct-92 01:35 UTC
28-Oct-92 01:40 UTC -to- 29-Oct-92 02:00 UTC

[Info via Kazu Sakamoto, JJ1WTK]

* SETI BEINGS TODAY *
=====================
NASA will restart its Search for Extra-terrestrial Intelligence today by scanning the heavens for radio signals that might be from life beyond Earth. NASA selected the 500th anniversary of Christopher Columbus' discovery of the "new world" to restart its SETI program. Just as a discovery 500 years ago opened up a whole new world to people in 1492, so may a SETI contact open a whole new world for us today.

* U5MIR ON STS MISSION *
========================
Cosmonauts Sergei Krikalev, U5MIR, and Vladamir Titov have been selected to fly on the US Space Shuttle next year. Both Cosmonauts will be arriving in Houston shortly to begin their training. At this time, it appears that Titov will be trained as a back-up in the event Sergei cannot fly on this mission. At this time, there has been no word whether U5MIR will operate Amateur Radio equipment from the Shuttle as he has from the Russian space station Mir in the past.

[Info via WA2GSY]

* QUAYLE QUOTE *
================
"Mars is essentially in the same orbit. Mars is somewhat the same distance
from the Sun, which is very important. We have seen pictures where there
are canals, we believe, and water. If there is water, there is oxygen.
If oxygen, that means we can breathe."

J. Danforth Quayle, January 1990

In trying to cure a problem with a VGA moitor interfering
with the radios, I am considering using a VGA-to-composite converter and
a VGA monitor. I have seen these advertsed in the past but cannot
now locate a source. Can anyone else locate a source?

To the best of my knowledge, repeaters have been recently
allowed to (or rather, no longer restricted from) having
any length hang timer desired.

If you want to leave your repeater keyed for 2 weeks,
that's fine with the FCC. Just be sure you're running
MICOR equipment. :)

There has always been the requirement that a control
operator must assert control of the repeater within
3 minutes of a violation of regs. I doubt that your
timer will suffice if I start verbally trashing your repeater, though.

Does this answer your question?

The only requirement for a timer on a repeater is that when under remote control the repeater must shutdown in three minutes if the control link fails. I presume reverting to automatic control in three minutes is adequate. I know of no requirement to time the autopatch or the squelch-tail at all. These are just engineering/administration concerns, not FCC rules.

I guess there's one other timer. You've got to have one that makes sure it ID's every ten minutes.

There is *NO* such rule.

> My question is:Do I need to receive SSB? I`d like to receive military

I seriously doubt that you are going to scan for SSB transmissions;
they are undoubtedly not going to be zero-beat on the same
frequency all the time, so you are either going to spend much
time tuning them in or listening to unintelligible SSB transmissions.

Above and beyond this, I would avoid the AOR line. From what I
have personally seen and from what others have told me they
can't seem to make a scanner which is worth much.

I agree, caveat emptor.

============================================================

SB DX @ ALLBBS $RTDX1009
VK2SG RTTY DX Notes, 9 October
RTTY DX Notes for week ending 9 October, 1992 (BID RTDX1009)

Due to medical problems of DX1 (VK2SG), a decision has been made to
split the preparation of the RTTY DX Notes up by people whom we feel
qualified to do so. We also decider to rename this bulletin the
'VK2SG RTTY DX Notes'.

This week will be DX2's (I5FLN) turn, the week of 16 October they will
be presented by Bob, WB2CJL, the week of 23 October it will be Jules,
W2JGR. After that for 30 October it will be John, TG9VT and then for
6 November it will be our old friend Syd VK2SG, and from there we
start the whole schedule all over again with I5FLN.

Now, without input from the readership, there is no material for the
bulletin. Please be generous with your DX information and please send
or forward it to TG9VT @ TG9VT.GTM.NA, who will see the right party
gets it for the week in question. To avoid major solar events, please
send in your DX info more then once a week, say every two days, as is
easily accessible to all of us. We all believe that this will give
Syd some of his needed rest. May the lord bless him.

Our thanks this week go to VK2SG, TG9VT, I5ICY, I5IGQ, F8XT, NT2X,
WD2AFT, AA55AU, NT3B, WB2CJL, W2JGR and the Twin-Cities DX
Packetcluster Network. Thank you all for your helpful notes.

Notes of Interest.

Sable Is. CY0NSM has been active on all bands including RTTY. They plan to be there until 9 October.

Burkina Faso. We have another new DX station on RTTY. Peter, XT2BW has appeared and will be on more often when he gets things in order. His tones are distorted but will soon be corrected.

The correct QSL route for P40RY and P4/G0AZT is via Don Hill, AA5AU, PO Box 625, Belle Chasse, LA 70037 USA. Cards that were sent to Eddie's box in Richmond CA will be forwarded to don, so there is no need to resend the cards.

Market Reef. OH1AF/OJ0 is now on and very active on all bands including RTTY. Activity will end 12 October.

Belize. Glenn, AE0Q will activate V31RY from 22nd Nov thru 31 Nov. QSL is via WN0B.

Bahamas. W5ZPA, W5LN and K5KR will be QRV from C6A starting Oct. 19 thru Oct. 23. No QSL route yet.

New Hebrides. Gran, SM4DHF with Jan, SM5LNE will sign YJ0C from October 21 thru 31. Before and afver the CQWW Contest will be active on CW/RTTY. RTTY QRG 14083 and 21083 KHz. QSL is via SM4DHF.

A special event station will be operating from Turk and Caicos from 9 thru 12 October using VP500CC call. For those who wish to have confirmation from that call send a 9 x 12 envelope and sufficient postage to W3HNK (no bureau) to get the nice certificate.

San Felix. John, XQ0X will be QRV again from San Ambrosio Island from October for a four month period. QSL via CE3ESS.

Europa. Jacques, FR5ZU/E is still there. He has cancelled his trip to Juan De Nova and plans for April or May 1993 a trip to Tromelin. Thanks Jacques for your outstanding activity.

Willis Island. Jim, VK9NS, and company should be on by the time you read this, and Jim promises plenty of RTTY. Look for VK9WW. QSL to home call VK9NS.

Other Good News. Cards from S2/HA5BUS are arriving, NT2X reports that he has the QSL cards for 9D0RR, Romeo's DXpedition and the cards will be out shortly. To end the best news: Syd VK2SG is back home.

In the comments on the results of the 1991 CQ WW DX SSB contest in Sept 92 CQ it says that because DARC has already added them to the WAE list, Croatia (9a1-9a0), Slovenia (S5) and Bosnia/Herzegovina (YU4/YT4/4N4) are separate from Yugoslavia for the CQ contest. So make sure you add the other two as well as S5!

> I would appreciate any information on getting around this problem.

Find out where the computer is, and route all your coax cables as far away from it as possible.

Ground the heck out of all your equipment.

Draw power directly from the battery, not the fuse block. Use a relay if you want switching on the ignition key, and use toroids on all cables.

Use a permanant (hole) mount antenna wherever possible; magnet mounts don't ground worth a darn, and mess up your finish worse than the permanant mount. Trunk lip mounts are OK if you make sure to ground the antenna mount more than properly.

A local ham did this with his Caravan, and he runs 50 watts on 2m and 440, as well as 100+ watts on HF with no problem.

I think they should drop it if they can't handle it. Then again they
should get rid of the beacon list and all of the other non repeater
info. But why don't they do this? Because it would make the publication
smaller and then they can't sell it for $6.00 therefore they would
not be making the profit by selling a directory that hardly changed
at all since the last directory. Imagine if they had only the repeater
info in there I would only buy a book once and never buy it again
because it wouldn't be worth buying since it didn't change much in
4 or 5 years get it? Its all a ARRL scam to produce a half-assed
directory with other bells and whistles with pages then last years
so it looks like things are happening for the advertisers. Too bad
the info is so outdated and wrong because it can't keep up with
the new technology out there. I'll never buy an repeater directory
again from ARRL until they catch up with the responsabilities.

Whats the other repeater directories name that was mentioned out
there with the "provate" repeater info?

Source record: 284460

Well, passed my Tech exam this morning and I've already been to the Ham Radio Outlet to look around. Basically, my situation is this: I can afford a good radio, but only one, and frankly the guy at the store wasn't much help.

First, I think that overall I would prefer one of those new small handhelds, but what kind of performance can I expect in the Denver area (say a suburban neighborhood)? I don't want to get one and then not be able to reach 7.225 and the other major repeaters from my house. For example, could a 5W handheld reach a Lookout Mountain repeater from the airport with the rubber duckie antenna? How about with a 1/2 wave?

I'm not going to go on about this, but do you think I would be better off going with the 25-50W mobile or will the handhelds give respectable performance?

Thanks for any info!

>Theoretically, I question the cost effectiveness of such a database.
>First of all, I would bet many hams do not know the serial numbers of
>the equipment that they bought (especially if they bought it used).

They should. It's your own damn fault if your rig gets stolen and you
don't have the serial number to give to the cops to prove that it was
yours if they happen to recover it.

>Second, I wonder how many of the rigs registered would ever be
>recovered on the basis of such a database. It would have to be
>registered, then somebody would have to go through the trouble of
>checking the database if a piece of equipment comes up for sale.

>Third, who would have the incentive to check the database? Not the
>seller of the stolen equipment. It is impossible for a buyer to check
>the database while at the hamfest.

Maybe the seller would think twice? Maybe not, but as a smart buyer, you
had damn well better have name, address, liscense plate, etc. of the person
you bought the stuff from, or YOU get nailed when it comes up as stolen...

>... After buying the equipment, why would the buyer risk losing the rig
>by checking the databse.

Because they are decent, honest human beings who were smart enough to get
all the information they could about the seller to give to the cops if it
turns up being stolen. Would you keep a stolen piece of equipment if you
knew who it was stolen from? I would not.

Greetings!

I am trying to help WB7QAP (Jim, Yakima, WA) find out what callsign his uncle had. His uncle's name was Edwin Bernhardt (sp?) Erickson. Mr. Erickson was born January 8, 1907 and died between 1954 and 1956. He lived in the Los Angeles area.

If someone has a directory and could find this information for me I would appreciate it greatly. If that is not possible I would appreciate some advice on how to go about tracking down this information.

Thank you in advance for any information/advice offered.

It seems from the comments in this thread that Internet mail is being answered reasonably well, probably because it is addressed to an individual.

I have *never* had a reply from the MCI address on the occasions that I've emailed substantive comments pertaining to an ongoing League matter.

3587. Docs for Alinco DR-110?

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-11 03:29:10 UTC
From: dtasman@NMSU.edu
Message-ID: <1992Oct11.032910.26840@nmsu.edu>
Source record: 284464

I recently purchased an Alinco DR-110 mobile rig at the El Paso Hamfest. Neat little radio, and a pretty good deal too. However, there was no documentation with the radio, so I'm at a loss to many of its functions.

While I understand what "volume" and "sqwuelch" are, there are nine buttons on the bottom of the panel. The buttons are:

1) F M W *
2) MHz (I think I know this one)
3) VFO/M
CH. SP *
4) REV
LOCK *
5) SHIFT
6) TONE
BEEP *
7) PRI
8) SCAN(think I know this one too)
SKIP *
9) CALL
CALL W *

* = labeled in blue

It would be much appreciated if anyone can tell me what the functions of these buttons are, and how they work. If not, a place where I can find documentation for this radio would be much appreciated!

73 (oops! can't say that, since I don't have my license yet ...)

```
Hi,

I have an ICOM IC P2AT 2 metre Handheld.

I can enter frequencies from 0 to 1310.

I can only transmit between 144 and 148, thats Ok
BUT when it comes to receive I have a problem.

I can go as high as 161 and as low as 118.
hen I go down to the Airways freqs it changes to AM.

Does this model receive above 161 or below 118 ?

I cant see the point of scanning between 0 and 1310 if
it wont receive these. There must be something wrong.

3589. HAMCOM21.ZIP - HamComm 2.1: Send/Receive RTTY/CW w/o modem

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-11 08:43:52 UTC
From: schroeder.pad@sni.DE
Message-ID: <4428.w8sdz@TACOM-EMH1.Army.Mil>
Source record: 284468

I have uploaded to WSMR-SIMTEL20.Army.Mil:

pd1:<msdos.hamradio>
HAMCOM21.ZIP HamComm 2.1: Send/Receive RTTY/CW w/o modem

What does it do:

- HamComm supports reception and transmission of amateur radio
teletype (RTTY) and Morse code (CW) signals.

- Converter not required, not even a modem chip. The audio output of
the transceiver is connected to the serial port of any
PC/XT/AT compatible computer thru a very simple and low-cost circuit.
Only one IC is needed (Op-Amp LM741 or similar) and a few diodes,
capacitors and resistors.

- For transmission the output signal is connected to the microphone
input of the transceiver thru a passive r/c filter. Audio frequency
decoding and serial/parallel conversion is all done by the program.
The interface schematics are included in the online help texts.

- MDA, CGA, EGA, VGA and Hercules supported. Automatic detection of
video adapter type.

- SAA-like user interface, mouse support, on-line help function.

- Harddisk recommended but not required. Needs about 320KB of free ram.

- Predefined standard texts, QTH distance/direction calculator
a callsign decoder, DOS shell while recption continues.

- HamComm is Freeware. If you like it a contribution of $10 or more
is appreciated, see manual for mail address.

What's new in 2.1:

-Sample config file and documentation in German and English (sort of :-)

-AFSK tones are now available on pin TxD of the COM port.
Get on the air without any mods to the computer.

-Added item to PORT menue to enable/disable PC speaker.
Added "set speaker <on|off>" command for .CFG files.

-Added macro keys.

-Bugfix in vertical line drawing routine for CGA displays.

-SCOPE function: hit '*' to enable/disable grid display.
Improves readability on LCD displays.

-Control-X clears current TX window line.

-Added item to FILE menue "Save RX Win & Log". Starts logging
RX window text just like "Start RX Logging" but also saves
the current window contents to logfile.

-Added "set insertmode <on|off>" command for .CFG files.

-Added "set entrymode <line|word>" command for .CFG files.

-Active logfile is now automatically closed on exit.

-Control-Z sends current time. Use \z in text elements.

-If the text elements "logrxlabel" and "logtxlabel" are defined
they will be evaluated and inserted at the beginning of every
newly written line of the logfile.

-Mode for Timer 0 is now restored on exit.

-Added new commandline options to control the video mode for
the graphics displays:
-cga mode 6, 640x200 2-color
-ega mode 10h, 640x350 16-color
-vga mode 12h, 640x480 16-color
-herc hercules graphics mode, 720x348 2-color

-The prefix database for the callsign decoder is now a plain
ASCII file and can be updated with a text editor.

-Added "set prefixfile <file>" command for .CFG files.
The default name for the prefix file is HC.PRE.

Unpack the .ZIP file and *PLEASE* read the
files README, CHANGES, HC.CFG and HC.DOC

Have fun!

Actually, automotive antennas are operated as high impedance voltage
probes. That's several *thousand* ohms impedance. The "coax" used would
better be called shielded high impedance hookup wire. This is necessary
for AM reception. If you were to try to operate the radio as an FM only
system, you'd have to have an impedance matching device at the antenna,
use 50 ohm coax to the preamp, use 50 ohm coax to the radio, and *redesign*
the radio's input circuitry to operate at low impedance. I don't think you
want to attempt that. Any performance improvements would be minor considering
grade A coverage is already at 50 microvolts per meter. The big problem with
FM broadcast reception is not too little signal, but too much signal from
adjacent stations.

>of it and would like to use it if it is at all possible.

RG6 is 75 ohm CATV cable. While it would sort of work, you'd have
a VSWR of 1.5:1, it's not really the type of cable you want. Use
RG213 or Belden 9913 for the run. These cables are rated for the
service you intend to operate.

>To mount the antenna to the house I am planning on using parts from
>Radio Shack unless someone would like to recommend a better source.
>I am looking at their 1993 catalog on page 100 and am wondering if
>the mount which attachs to the eaves (figure 7) would be very

>any of the other attachments in the catalog or anywhere else that
>you think may be better please suggest them. Also, one point about
>the attachments which are nailed or screwed through the shingles:
>how do you prevent the holes from leaking.

The Radio Shack chimney mount, the roof tripod, and their push up
masts are all suitable for mounting a large dual band base antenna
like the Comet 2x4MAX, which I highly recomend. The eave mount should
work for a smaller antenna like an AEA Isopole, though that's not
a dual bander, or for the smaller Diamond 50 series dual band antennas.

Naturally, you want your antenna as high as possible above the roof
line. The chimney mount is a natural if you have a chimney. If not,
the roof tripod is a good choice. Use a 10 foot section of masting
with either, and with the Comet on top and you'll have a good antenna
setup.

An alternate method is to use their 40 foot push up mast from the
ground. Attach the mast to the house with a 2x4 and a U bolt at
the highest point that you can. That will avoid having to use
guy wires on the mast. It will support a big vertical like the
Comet.

You don't want to nail a mount to the roof. You want to use large screws for strength. The screws should go through the decking and engage a rafter for best results. With the roof tripod, there are "feet" on the tripod that rest on the roof. To prevent leaks, you smear roofing tar liberally over the feet after you have screwed them down securely.

Don't forget to ground the mast for lightning protection. A bare number 8 copper wire down to an 8 foot ground rod is required. Also be sure to use a proper lightning arrestor in the coax. A Polyphasor IS-EMP-1 would do nicely. Blitz Bugs and the like are pretty well useless for real protection of your equipment though they may prevent your house from burning down. Radio Shack doesn't have anything suitable, get your suppressor where you get the cable.

I have found that the vast majority of hams are completely honest with other hams; with one exception the only crooks are the non-licensed people who seel equipment to hams, etc.

A packet server serial database would make it easy to use at hamfests, but might be too close to the "antibusiness" rule to be ok.

I'll work a sked with you. I still have a 10 meter loop in the air and we might make it. I'll have to dig out my 10-10 number (its close to 20 years old now). Weekends are fine after noon. Name the time.

3599. Is UPS actually using 220MHz?

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-11 18:52:42 UTC
From: wa2ise@cbnewsb.cb.att.com
Message-ID: <1992Oct11.185242.3545@cbfsb.cb.att.com>
Source record: 284475

Was wondering, now that United Parcel Service has had 220 for some time
now, if they are actually using it. If they are using ACSB(sp) modulation
system? Heard that they deciced that ACSB really wouldn't work too
well. Maybe, if they don't use it, we could get it back, maybe make it
a packet band? SURE.

Well I guess it was wire line, but I'm not sure. Or it could have been some kind of ship communication method.

Do any europeans reading this know if this is the case in Europe ??

I did not know you could do that, I remember a few years ago I had
a problem with a supplier and when I rang visa they said that was a
problem between me and the supplier and if a refund was due it would
have to come from supplier, which of course it never came, this is
about 7 years ago, things may have changed since then, anyone know
about European Law?

Please Help

I have a Bearcat 300, and it has a problem,
the display does not come on right away,
after a few minutes it comes on dim and
then gets to half brightness.
the dim button turns it off and on.
also the scanner "searches the buttons
ok and searches input limits, however
if you program a channel as soon as
you change anything, it loses the
memory.

I am wondering if the Erom on the
front panel is the problem, but I
don't have access to one to try
and I am in an area where it take
forever and costs lots to order parts.

If anyone has any ideas, I would
appreciate any help

thanks

Last I heard, UPS had decided instead to use cellular phones.
Nevertheless, they reserve the stolen bandwidth because they were
planning to use it Real Soon Now (tm).

Got a Bearcat 260 scanner for cheap, whose keyboard assembly had lots of dead buttons. Took it apart and it was some foils on the bubble keyboard assembly that had corroded. Well, needless to say, trying to fix that made it worse. Tried using conductive paint, but it was too far gone; fix one thing, then another thing goes wrong!

Are parts available? Does the supplier deal easily with individuals with VISA/Mastercard accounts?

Ohio packet IS listed!

We made a list. We sent it to our Section Manager, Dave, N8AUH, our Division Director, Al, AB8P, to the editors at the ARRL, to our repeater coordinators (with whom we were unsucessful with in the past). Each copy was sent with a cover letter expressing our needs and the fact that they have not been met. We talked to our representatives, we talked to Newington and we got in.

However, you will have to put in the time to get and update a list, contact your representatives and follow up on it. Your job, NOT the job of the ARRL.

In response to how to get new member, the Ohio State ARC had about the same problem. Last year we had 5 or people and an advisor. We petitioned the University for funding and "should" receive some funds later in the month. In the intrim, we put in an ad in the student newspaper. We had 20 people show up for the first meeting. I am going to make a press release for the studend newspaper on the upcoming CQ WW SS coming up in 2 weeks. If the press release is published, it will include a note that if your interested in ham radio, stop by during that weekend. The next step we are going to take is leading non-licensed people to classes so they can get their ticket.

There has been some discussion on holding a workshop during the Dayton hamvention so that club officers like you could discuss what worked getting the club active and what didn't work. If there is enough interest, I'll write the folks at Dayton to express OSU ARC doing that.

If you need any additional information, EMAIL me.

3611. Sony GPS Receiver ??

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-12 00:01:59 UTC
From: rc@cmr.ncsl.nist.gov
Message-ID: <9210121403.AA01228@cmr.ncsl.nist.gov>
Source record: 284417

A recent message asked for comment on the Sony Pixis GPS receiver. I cannot claim personal experience, but press reports have been very negative. "Practical Sailor", a no-advertising product-review newsletter, has been so negative that they don't print a detailed review in their latest GPS listings. They lioke the Magellan best, but don't find much wrong with Trimble, Garmin, and many others. $995 is a rather high "street" price these days. For example the Garmin was going for $689 at the Annapolis Sailboat Show this weekend, and doubtless be the same at the Powerboat Show next weekend. Even the all-American Timble Ensign goes for less that $1000.

No endorsements given; no personal experience in GPS; your kilometrage will vary.

[some deleted]

>I am wondering if the output of the tuner box is much wider (in frequency)
>than just channel 3...

Mine is. It bleeds over heavily into channel 2 and a little into channel 4.
You can see a very poor picture on ch2 and the audio is near perfect on ch2.
Ch4 has a little audio and a barely noticible video signal. BTW, if it
matters, this is on a mechanical tuner...

>will I need a really wide notch in order to kill
>all of its output ?

Probably a ch2 and ch4 notch band-reject filter on the output of the
cable box would work, of the ch2 and ch4 on cable are strong signals.
I am talking about those filter that the cable TV gadget companies
sell to block a channel from the cable.

>Perhaps several filters would be needed in series
>to completely kill the channel 3 from the street ?

One notch filter might be enough.

>Would the channel 2
>and channel 4 from the street bleed over into the channel 3 output from
>the tuner box ?

Probably not.

>Has anyone done this or know of an off-the-shelf solution to this apparently
>simple (and annoying) problem...

I bought a Tru-Spec channel 3 combiner from MCM Electronics a while back for about $15. It is supposed to do exactly what you ask. It has a cable input, a ch3 input, and a combined output. It is supposed to reject ch3 from the cable input, filter the ch3 input to only ch3 (no bleed over into 2 and 4) and then combine the two signals. But it doesn't work. It doesn't block the channel 3 from the cable enough. You can see significant ghosts of the old cable channel 3 in the combined channel 3 from the cable box. I even took the top off and tried to tune the filter circuts by spreading some of the air-core inductor windings to change inductance. I improved it's ch3 rejection slightly this way, but ghosts of the old ch3 and hum bars were still plainly visible...

Sounds fine to me. If you had a choice between doing business with someone that was constantly exhaling noxious fumes and contaminating everything you bought from them with those fumes, and with someone whose service, support, selection were just as good but WITHOUT noxious fumes, who would you buy from?

Quite frankly, I don't care what someone else wants to burn and inhale as long as they don't force me to inhale it as well.

I'm an absolute beginner to the Amateur Radio world, and I know very little about the best ways to go about setting myself up with equiptment and finding local support in the Chicago area (western suburbs). I'm about ready to test for Novice and Technician with the CW test and all, but I don't know where to test or if there are local organizations for Amateur operators. Actually, I'm sure there are, but I wouldn't know where to start. Can any of you veterans help?

>

Maybe this is just a Left Coast phenomena, but does the state actually
allow smoking in retail stores? It has been illegal in Washington state
for quite sometime, although it took awhile for the retailers to catch
on.

You might inquire with your local lung association and find out about
the laws and enforcement.

In the Seattle area it is very rare to walk into a retail establishment
and see or smell cigarette smoke. We had a surplus electronics store
here in town (United Products) where everyone there smoked on the
job. The fire dept started hassling them, and then they put up signs
saying it was a private establishment and that if you didn't like
smoke, don't come in. This didn't help their case, as the law looks
at this like they would a restaurant that doesn't comply with health
dept rules, but posts disclaimers.

United Products went out of business awhile back. Don't know if
the fines from the fire dept had any part in it or not. I imagine
that given the choice, nicotine addicts may choose to close down
the source of their livlihood rather than give up tobacco.

THE REAL SCAM is that is costs $$ to be in it as well as to buy it. While I
will agree that the ARRL is all we have lobbying for us in congress, they
could do a better job with a few things....

For those with the '92 (blue) directory make this addition to the IOWA pages

Not at all. Her point is that the smoke is *physically unpleasant* to the customers. The objection is not that _they_ smoke, but that they force _us_ to breathe acrid fumes.

I would question the business sense of people who can't be bothered to remedy a problem that is making their store physically almost intolerable to many of their potential customers.

The Bearcat BC-300 scanner has been around for 12 years.
Here is a reprint of an article I published in my column in
the August 1989 issue of the RCMA Journal.

DON'T JUNK THAT OLD BEARCAT BC-300

Although the Bearcat BC-300 scanner is no longer available,
it occupies a fond place in my collection. I exercise lit-
tle self control when I see a used BC-300 for sale cheap,
and have adopted two broken units. They make fine radios
after repair.

The BC-300 was the forerunner of today's 760XLT. It was a
50 channel feature laden scanner, introduced around 1979,
back when Bearcat was part of Electra. Retail sales of the
BC-300 continued until 1987, when it was discontinued by
Uniden.

Although Electra offered the pricey BC-350 as a step above
the BC-300, firmware bugs and a batch of bad power
transformers doomed the 350, and the 300 remained the jewel
of Bearcat line.

It's easy to see why the BC-300 model was offered for
several years. It boasted premium features like a clock, a
carrier operated solid state relay for tape recorder activa-
tion, a transmission counter, and a Service Search of 11 ROM
banks of preprogrammed channels. For memory, the BC-300
used EAROM (electronically alterable read only memory), so
backup batteries were not necessary. The Dog House, a radio
shop in Fairfax, Virginia, at one time offered the DH 1000,
a 1,000 channel adapter for the BC-300! Unfortunately for
federal band listeners, the BC-300 lacked coverage of the
138-144 and 406-420 MHz bands.

While outwardly impressive, internal construction was typi-
cal of Electra hand wiring in that era -- a bit messy. BC-
300 schematics show at least 100 components changed between
earliest and later units. The scanner went through many

circuit design changes, but rather than changing the printed circuit board, new components were tack soldered on the foil side in different positions.

Electra stamped all of its scanners with a manufacturing date code on the rear of the cabinet. The code is comprised of a single character (C = Cumberland, Indiana, P = Puerto Rico), followed by four digits denoting year and week the radio was built. For example, "P2284" denotes the radio was made in the Puerto Rico factory during the 22nd week of 1984.

Switching power supply failure was common in early units due to insufficient capacitance. Electra responded by increasing the value of capacitor C98 from 22 ufd/16 v to 47 ufd/25 v, but I recommend 47 ufd/35 v. If your display is getting abnormally dim, C98 is probably the culprit, as it was in five Bearcat scanners I fixed.

Squelch preset potentiometer R81, mounted on the radio circuit board, was misadjusted in new units, requiring readjustment after the components aged.

In one radio, I replaced Q9, a small signal PNP transistor. Its failure caused the BC-300 to become deaf on all but the UHF band. Failure of squelch gate transistor Q15 caused the squelch to remain open at all times.

Cold solder joints, especially on the wires and ribbon cable connecting the radio board to the logic board, have been responsible for other failures.

I have seen serious IC failures in three BC-300s built around 1984. These include CPU chip IC201, memory chip IC202, and IC203, not in stock at your your local Radio ShackO.

The BC-300 circuitry, especially on the radio board, is very similar to the circuitry in the the BC-220, BC-20/20, BC210XL, and BC-350, so some of the previous remarks may be applicable to these models as well.

I can neither furnish schematics nor repair your radio. If you come across a broken BC-300, obtain a schematic from Uniden and spend some time troubleshooting. If you give up, your BC-300 can be fixed by Electronic Repair Centers in Franklin Park, Illinois, (708)455-5105. I'm told they do good work. The BC-300 is a classic scanner and worthy of your efforts.

an someone please help me. About 6-9 months ago a thread on producing
PCB etch resist patterns by ironing on photocopy images was running strong.

In particular reference was made to a photocopy film/paper especially
designed to facilitate the process.

Can someone post (or better still email me) a pointer to an archive site
or the consolidated thread. I am particularly interested in the film/paper
needing a manufacturer name/address and model number. If someone knows
who, if any, is the Australian distributer all the better.

Thanx in advance

I have used these in the past. They work quite well only if channel 3 is
unused on the cable input.

A Channel Plus modulator will probably do what you want. Their hyperband model
modulates on any cable channel between 37 and 64.

>where you are :-)
>Does anybody have any experience/reviews of this unit to share?

Hi Jim,
I have no personal experience of the unit, but I do remember seeing a review recently in Yachting World which compared the Sony unit with an Ensign unit from Trimble, a Magellan unit and another unit that I can't remember at the moment. As fas as I can recall, the Ensign and the Magellan came out tops. The Pyxis system came in a bulky case and looked a bit fiddly. However, it did have a detachable antenna you could stick up high some distance from the unit to get a better signal. I thought the Magellan unit was neat because it was waterproof and it floated. None of the units would work well indoors (not surprising :-) and battery life in most cases was in the order of less than an hour, which is pathetic.
I'll dig out the entire review tonight and post relevant details tomorrow.
Cheers,
Simon Woodworth.

3626. Kenwood TS430s power fault

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-12 11:28:18 UTC
From: ik3huk@sabrina.dei.unipd.it
Message-ID: <Bw0AJ7.16p@dei.unipd.it>
Source record: 284414

Hi there !
As you read in the subject I have some sporadic but very annoying troubles
with my 1988 Kenwood TS430s. This is what happens to my gear (and the same
occours to the rig of a friend of mine):

Approx. every 3-4 hours of CW operation (while working without any problem)
the power output drops down to a few watt (tipically duringa pileup and when
the dx sent 'ik3huk 599...'). During this power-loss the ALC level is low
(regularly).
To have back the full power I have to do the following:
-Turn CARRIER knob fully clockwise (full power position - ALC doesn't move)
-Key down for several seconds (very looooong time when in pileup)

I sent the radio to a laboratory for repair (and friend of mine did the same)
but they're not able to reproduce the power-fault when the radio is on their
table. They cleaned up all the relais, but the RTX is still loosing power.

PSE sorry my scholastic english and ... TNX in advance.

ik3huk Diego Serafin.

P.S. e-mail to me: I will repost the solution (if it will come!)

While there are people who are completely intolerant of cigarette smoke, they are a minority. Most people don't mind, and some are positively delighted to find a place that doesn't impose a draconian ban on smoking in their establishments. It is a business decision, of course, do you annoy the 25% of the population who smoke to appease the small vocal minority of complainers, or do you alienate 25% of your customers to keep that minority happy. The bulk of the population cares less one way or the other, no smoking areas are a recent development on the commercial scene.

3630. 10M Mobile Ant. Recommendations

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-12 12:43:22 UTC
From: UWELTO@UNC.OIT.UNC.EDU
Message-ID: <9210121242.AA09528@ucsd.edu>
Source record: 284412

Thanks for the response to my question regarding 10FM activity. Our ARES group is seriously considering using 10FM as a backup to our repeaters. We have done some tests and find that a simplex frequency can cover most of the county which consists of gently rolling hills. Two meter simplex is not effective due to shadowing.

We have used only base stations at this point and one mobile which is using the Outbacker antenna. This mobile has had some problems with receiving the ground wave signal. He is using a trunk lip mount on one of those small Japanese cars. Could anyone recommend a good mobile antenna for 10M FM. I am also interested in any info about problems with ground wave reception on this band (the fellow with the Outbacker does very well with his sky wave signal). We are using 29.010 as our working frequency. Any other comments about 10FM simplex and mobile operations are appreciated.

hope this gets back to you...

you have a working repeater system -- do you do anything with it? (amateur
radio newsline reports, for one..?)

from my experiences at Rose-Hulman in 1977...

get the advisor to find out if admissions has any information on
incoming freshmen's interests. if successful, go press some flesh.

get a copy of the callsign tapes from the callsign project guys then
run it against student names to extract unknowns. (do the faculty
while you're at it too). could be the best $20 + tape + ship you
can spend today...assuming you can get the computer resources..

hold a shack clean up and picnic in the spring....clean up the shack
in the morning, then in the afternoon or evening go to a park and
have a cookout....everyone that works gets to eat.

you ARE holding published meetings...? dues reasonable?

hold exams - hopefully regularly...school club's participation is
to provide rooms and maybe some VEs...announce in school paper.

run some traffic for thanksgiving and christmas (25 words or less) like "hi mom x be home november 24 x love son", put message forms in school newspaper, ship data out on packet (we had to do it all on phone...)

work with school newspaper to get an article or two up and running on amateur radio featuring "da station" and such.

make certain you can put on a show during any major school open house or festival...could be people aren't even aware of your presence.

hold a fox hunt. get the club station up and work WAS (doesn't matter if it's been done before...). hold a weekend class in amateur radio - sounds like if you get 1 you increase your club size by 50%....

go after grad students and seniors that are working on communications projects yet aren't hams....might get some nibbles there.

oh yeah, you have to do this w/o letting school slip. obviously, that's got to come first...but even if you can only get one activity going you are ahead of the game (and as people come on board you can increase the activity load..).

73, bill wb9ivr

3632. Needed: A YAESU FT-747 GX rig

3634. Motorola Gemini power-FETS for 2-meter linears

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-12 13:41:19 UTC
From: pjml@swmis.nerc-swindon.ac.UK
Message-ID: <9210121435.AA07466@swgen-t>
Source record: 284415

I am in need of a high-power (150 watts continuous-duty) mobile linear for 2 meters. There seems to be nothing sensible on the market, so I have just invested in a set of applications-notes for the Motorola Gemini-series of dual-power-FETs which seem ideal for the task. Has anyone got any experience of how well these perform?

-Pete Lucas G6WBJ : 'Openness' is like Virginity;

In rec.radio.amateur.misc, FDBBC@cunyvm.cuny.edu (Fred Bogin) writes:

>Does anyone have a way to cure RFI from a light dimmer on a halogen lamp?
>It's only on AM radio and is carried by the house wiring. (i.e. we don't
>have it if we run the radios on batteries) Thanks.

A differential-mode AC-line filter, commonly called a "brute-force" AC-line filter will probably take care of the problem. You may want to experiment with its placement, trying it at the radio and/or at the dimmer.

It may also be necessary to add a common-mode choke, made with about 10-20 turns of the AC-line cord or AC wiring (the house wiring should only be modified by a licensed electrician) wound on an FT-240. 73-, 75-, 77-, J- or 43-type cores will probably all work.

Here is some information from the ARRL RFI Tips package. A paper copy of the entire package is available for an 8X12 SASE and 98 cents postage from the ARRL Technical Department Secretary.

Some customers, perhaps. Probably me, too. But I don't let it bug me to the point I lose perspective on why I am doing business with someone.

How much can one reasonably expect customer preferences to define personal behaviour on the part of the owner? It seems to me that one can reasonably expect quality of service and other business related concerns of the owners, but it is entirely unreasonable to indirectly define their personal behaviour. This might be more clear to you if the issue wasn't smoking (given its recent unpopularity) in the store, ie substitute age, ethnicity, race, etc for familiar reasons we all agree are incorrect when used to differentiate. Discrimination is wrong, whatever the reason given.

As other posters have mentioned, the output of the tuner box will most likely be a wider, DSB signal as there is no need for VSB filtering in that application. This will mean that the channel 3 output of the tuner box will "walk on" a portion of the channel 2 from the cable.

Perhaps a highpass filter that cuts in just after channel 3 would be a better choice than the notch filter I originally proposed. This would kill both channel 2 and 3 from the cable... but they would still be tuneable by the tuner box...

So, how much attenuation is needed to kill one of these signals ? What levels are we talking about here ? 20 dB ? 45 dB ?

In a follow up to my article, that protested the sub band allocation for
unattended automatic packet on 30m and 160m, Gary Coffman (gary@ke4zv.UUCP)
writes:
>
>>> 30 M: 10.140 - 10.150 MHz
>>
>>TWENTY PERCENT OF THE BAND SPACE! I think that this way too much
>>on a band that is a haven for non-contesting cw operators.
>>How about *no* allocations on this band. Consider the fact that
>>the max power is 200W. This would heighten the hidden transmitter problem
>>in AX.25 style (or any carrier sense multiple access) operation.
>
>This is exactly the section of the 30 meter band *currently* being used
>by the STA stations. It's consistently been the most useful band during
>the STA period. A casual listening survey of the band indicates that there
>are *currently* more packet signals in this small segment than there are
>CW signals in the entire 30 meter band. I think you protest too much.

Well, Gary, you have just hit upon one of aspects of unattended automatic
hf packet. Consider two cases:

i) Good 30m band condx. I betcha you will find the cw portion of the
band wall to wall full of cw activity. And yes, you will also find the
packet stations.

ii) Bad 30m Condx: intelligent cw operators move to some other band
or mow the grass. Unattended automatic packet stations are still trying
to send the photons thru ad-nauseum. Yes, in such cases when you can
still hear some near by packet stations or some station along a path
that is not fully degraded it will appear that the 30m band is being
used primarily by packet.

Unfortunately, this summer has not been great for hf. We have had
some really bad propagation conditions for weeks this summer.
So a random casual examination or a time average might indicate that
30m is used mostly for hf packet.

So, I still stand by my remarks that 20% of the 30m band is excessive.

>

>>> 160M: 1.810 - 1.820 MH
>>>
>>
>>Whoa!! This is just about the hub of cw activity on this band. Of my

>>last 10 cw contacts on this band, eight are in this segment. In my mind
>>this is like requesting 50Kcs in the 28.3 to 28.5 band.
>
>No, it's like requesting 10 kHz in the 28.1 to 28.3 MHz band. In fact,
>the request on 10 meters is for 69 kHz in that segment. There's
>already a unique 10 kHz of DX window on 160, another small window in
>a sparsely populated band is not excessive. You still have 40 kHz of
>CW *exclusive* bandwidth, something no other amateur band shares, and
>150 kHz of mixed mode space. Buy another crystal for crying out loud.
>

Now let us see: Most of the CW activity on 160m takes place in 1.800 to 1.840 (which includes the DX window that is shared with phone). A subband allocation of 1.810 to 1.820 represents 25% of the part of the band where most of the activity takes place.

Correspondingly, 28.300 to 28.500 represents the hub (but by no means all of) of phone activity on the 10m band. A 50Kc sub band would be 25% of that in Kcs and in the number of potential qso channels.

So, I ask those of you who use phone: How would you like to have a sub band allocation for unattended automatic packet from, let us say, 28.350 to 28.400?

Not a pleasant thought, is it?

Precisely, how I feel about the 160m unattended automatic packet subband proposal for the 160m band.

Nuts.

And, I do not think I protest too much. If you still have doubts, please re-read the previous few paragraphs.

Thanks for the review Chuck. A suggestion for fixing the volume control problem:

If the pot is of linear taper, then replace it with one with an audio taper.

If it has an audio taper then consider switching the side leads on the pot. This will make the pot reverse (clockwise for less volume) but it might expand the desired part of the resistance range.

This is a very versatile handie. I have used it at special events with the 7.2v/700mah battery for the duration of a triathlon (7 A.M to 12 noon) with no problems. I was the "tail" for the race director, so I was on the air a lot.

The mods are a snap. I also like the ability to set just about ANY offset frequency. (Great for MARS.) I travel a lot by air, so picking up AM air freq's is nice, also.

To Dan Pritchett (KM6PR): My understanding of the MONI feature is only to allow the squelch to open in case you want to check for a signal "down in the grass".

I also have an ALINCO 2M mobile rig that has been running great for 3 years.

(P.S. I have no affiliation with ALINCO other than as a satisfied customer.)

I went to Barry's once and tried to buy the Yaesu FT727 bual band HT. Kitty, or Twitty, or Lulu, whatever her name is, went into the back room, pulled a rig and gave it to me. Before I handed over the cash though, I decided to take a look at the rig first. The box was mint and everything seemed like the box had never been opened. But, when I removed the rig and actually looked at the keypad, it was apparent the rig had been used. When I protested, she lead me into the back room and let me pull the one I wanted myself. That was a good thing since some of those rigs were slightly out of date, and I was able to get the newest one.

If this could've happened in the store, what would they do with mail-order sets?

3644. batteries, CCA to A-hr conversion

Newsgroup: rec.radio.amateur.misc

With all this talk about batteries, I Have a question.

Most car batteries no longer have an Ampere-hour rating, instead they have
a CCA, cold cranking cranking Amperes, rating.

I have heard that there is a conversion factor between CCA
(cold cranking amperes) and A-h.

Is this true? If so, what is the conversion?

(Please don't respond as to why the CCA rating
is used. I know that already.)

I think batteries are swell. They are little containers of energy.

Trimble navigation (San Jose, CA area) has a better unit. Unlike the
Sony unit, the GPSS antenna is part of the case making it more of a true
portable. This is the unit (or perhaps a miltary version) which was used
in the Gulf War. It is about the same price as the Sony Unit. I have
seen it mail order from a least one place, you could also call Trimble and
ask them where to get it.

Mike

>This is a fraud alert. The following letter was FAXed and certified mailed
>to MAX systems AKA "Mr. CD" on Friday, October 2nd. As a result of my
*----

This really surprises me, since I've bought from him a few times.
I've never had a problem with the merchandise, and prices were
very good. I have considered mail-order from him (but he's been
at enough hamfests this season that I haven't needed to).

Wondering... Doesn't a posting like this, prior to knowing *fully* the
reasons, circumstances, etc. open one up to a libel suit? What if the
owner reads notes, too? What if he documents that a drastic decrease in
business was caused by a negative posting... etc. etc.

Any thoughts?

>PS. I don't smoke, no one in my house smokes, etc.

Haven't you noticed all the ads in QST, Nuts & Volts, that offer equipment for sale with the notation "Used only by non-smoker?" The reason is that equipment which has been smoked around is simply not as valuable and that which hasn't.

If I ordered a rig via mail order, new, and it arrived reeking of smoke, I wouldn't even open the box. Haven't you ever heard the term "Smoke damage?" Certainly no one has heard of "Smoke Enhanced."

No one smokes in my house, either, although the XYL does smoke.

> Miles Abernathy, N5KOB

I don't know, Miles.... I thought the Archie books were picked because they were for an older crowd too. It's unfortunate the ARRL guys can't lock into a set of promotional hooks so they have material that works across the demographic spectrum - not just the guys w/o teef.

I still want Ren & Stimpy radio PSAs....even tho there seems to be a snag between Spumco, Kricfalusi, and Nickelodeon...<sigh - obviously the people involved can't say "Teenage Mutant Ninja Turtles" with only 4 new episodes in a year...they probably can't even say "Tiny Toons Adventures"...>

Can see John DeLancie being used: "As the being 'Q" on Star Trek, The Next Generation, I can visit other lands with a mere thought. But you humans can do it almost as easily through the miracle of amateur radio...".

Maccauley Caulkin (the "Home Alone" kid, don't know if the spelling's right): "If every one in my family were amateur radio operators, they might have a harder time leaving me behind. .."

Maybe the next time Stan Freburg (and son??) make a encyclopedia commercial the kid would look up something on radio...?

And of course, there's all those 49 MHz toys sold (even with code keys on them and morse code printed right on the unit) but not even a postcard to attempt to get a link going. in a couple more years these should all mutate to toy cell phones and we'll have lost that angle...

[anyone for an OS/2 based morse trainer? it would be neat to have one, and -no- i don't believe i'm skilled enough to be the one to write it...]

>Rest deleted.

Luck,

Perhaps one suggestion would be for us to always send an acknowledgment, letting the member know it got here, and informing the sender to whom it was sent. If it is a director, or perhaps someone on staff, at least the correspondent would know that it hadn't dropped off the edge. Perhaps what went unsaid here is that the MCI mailbox is "opened" by a secretary, who sends the correspondence on to the appropriate committee, Director or staff. Often, the recipient (especially those who are not on our internal network) may take the printed message as informational only, assuming that a response has been taken care of by someone else with direct access to the writing member.

I will also take the time to point out that members should *always* include their postal address in all electronic correspondence to ARRL HQ. We often need to send non-electronic material, or may need to forward your request to someone who doesn't have email access. This will help ensure that you get an answer, even a slow-mail one. I bet some of the non-answers to MCImail sent to 2155052@mcimail.com were caused when the ultimate recipient could not respond to the email address. A fair number of MCImail account holders also do not know how to send mail to an Internet address, so that may explain some of the problems, too.

>But sending commentary to unstated persons at ARRL HQ, in the
>hope that we might be able to determine what your question is,
>might easily lead to the same types of experience that Rolfe
>has had to endure. And THAT we want to fix!

I agree that this is a problem that should be fixed. I am sure that Luck has the situation well in hand.

Cross-posted to: sci.astro,rec.radio.amateur.misc,rec.radio.shortwave

/\

MINOR GEOMAGNETIC STORM ALERT

ISSUED: 19:00 UT, 12 OCTOBER

/\

ATTENTION:

Geomagnetic activity unexpectedly surpassed the minor storm threshold at
15:00 UT on 12 October. Major to severe storming was observed after 06:00
UT. Activity has subsided somewhat over the last six hours.

Moderate to strong attenuation and degradation of HF radio signals over
the high and polar latitude paths have been observed in conjunction with this
disturbance. A definite enhancement of signals was observed near the onset
of the observed activity. This has been followed by typical moderate to
strong degradation. A clear source for this activity is presently not known.

Conditions are expected to stabilize somewhat over the next six to
twelve hours. Periods of minor to possibly major storming could still be
observed over the local night sectors during the next 24 hours. The field is
expected to be fairly unstable for the next 3 to 5 days.

** End of Alert **

3657. AURORA WATCH: Middle Latitude Auroral Activity Watch

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-12 19:36:53 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.718918613@honte>
Source record: 284339
Cross-posted to: sci.astro,sci.geo.meteorology,rec.radio.amateur.misc,rec.radio.shortwave

/\

MIDDLE LATITUDE AURORAL ACTIVITY WATCH

ISSUED: 19:00 UT, 12 OCTOBER

/\

VALID UNTIL: 19:00 UTC ON 13 OCTOBER

MODERATE RISK PERIOD: 12 - 13 OCTOBER (UT days)

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: LOW TO MODERATE

EXPECTED LUNAR INTERFERENCE: HIGH

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: FAIR

AURORAL ACTIVITY MAY BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

NORTHERN WASHINGTON STATE TO SOUTHERN MONTANA TO SOUTH DAKOTA TO
MINNESOTA TO WISCONSIN TO MICHIGAN TO NORTHERN NEW YORK STATE TO NEW
HAMPSHIRE AND/OR SOUTHERN MAINE.

ACTIVITY MAY ALSO BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

THE U.K. TO DENMARK TO SOUTHERN SWEDEN TO SOUTHERN FINLAND TO
NORTHERN RUSSIA TO SOUTHERN ALASKA. SOUTHERN AUSTRALIAN AND NEW
ZEALAND REGIONS MAY ALSO SPOT SOME WEAK ACTIVITY ON THE SOUTHERN
HORIZON, ALTHOUGH LUNAR INTERFERENCE WILL BE HIGH.

SYNOPSIS...

A sudden and somewhat unexpected burst of auroral activity was observed
after approximately 08:00 UT. Strong auroral storming was prevalent at
times over the western half of North America north of the U.S./Canada
border. Activity has remained moderately active. Conditions are
expected to be most favorable for observations over the northern
European regions for the next six to twelve hours. Some stabilization
is expected before North America enters the night sector. However, the
northern tier of the U.S. states may still be able to sporadically
witness some of the activity.

Strong lunar interference will significantly hamper attempts to view
activity, making this a rather poor opportunity to observe aurorae.

This WATCH will remain active until 19:00 UT on 13 October when it
will either be updated or allowed to expire.

** End of Watch **

3658. Re: ARRL RPTR Directory Stinks :-((?)

The ARRL compiles lists that are sent in by the recognized local repeater coordinators. This is done once a year. In Northern California there are over a hundred changes just to the voice repeater listings. About a 10 - 15 percent update.

Does one really need a directory to operate packet ?

I dont think so...

Nodes will tell you of Routes....

BBS s have files of info if you just look.

Northern Amateur Relay Council of California publishes a Local Repeater Directory twice a year. Four Dollars postage paid. PO BOX 60531 Sunnyvale, CA 94088-0531

What kind of digital activity should be published ?

Network Nodes KaNodes BBS PacketCluster TCP.IP servers

in other words service providers....

Should the 5000 home digis in nor calif be published ? NOT

Bob Wilkins n6fri <editor Northern California Repeater Directory>

> ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
I wish to echo my PROTEST and agree 1.810 to 1.820 MHz is UNAPPROPRIATE!!!!
The above comment shows lack of understanding of DX CW work on 160m.
As operation over a wide frequency range on 160m is at best "problematical"
consuming a specialized communications technique right in the middle of the
CW only part of the band (and just below the CW DX window) is "stupid" in my
mind. There is a plethora of room higher in frequency on 160m. Why not
a compromise such as taking a sliver of both CW and Phone frequencies, ie
1.850 +- (intent is between CW and Phone bands, freq might be off).
This way you're out of both modes' hair and, in addition, create
a kind of "no mans" or buffer zone from the two modes.

A kind of "mode animosity" already exists between CW and Phone on that band
why add digital modes to the fire when proper placement can minimize impact.
Also, the band is not so sparsely populated as is popularly assumed. Compared
to 20m yes, compared to 220MHz (which everyone is so quick to moan and

complain that we lost a chunk), it is well populated.

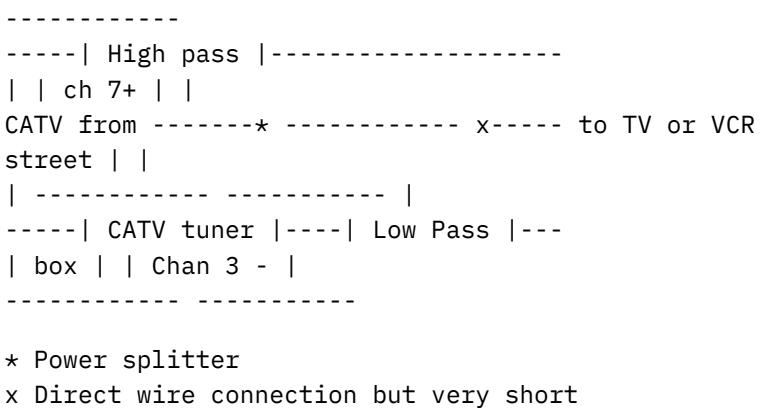
I did the below when my cable company just had trash channels below channel 9. I didn't care if I could only get them via the box. It worked very well. Now if I can only find the schematic. I built the thing years ago



* Power splitter
x Direct wire connection but very short

If the filters are designed to have a high output impedance out of band you can just tie the outputs together and not suffer an extra 3dB loss from a combiner.

The high pass needs about 60 db of isolation for Channel 3 to get a really good picture. The low pass didn't need to be so good in my case as the output of the cable box only went up about a 1 1/2 channels. Both filters were around 7 pole jobs.

I did the above when my cable company have trash channels below ch 13 and I didn't really care if I needed the Cable box to get them. It worked fine. Now if I can only find the schematic. I built the thing years ago.

3667. Re: Kenwood TS430s power fault

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-12 22:27:27 UTC
From: sam@wa4phy.ampr.org
Message-ID: <1992Oct12.222727.8615@wa4phy.ampr.org>
Source record: 284344

Don't know if you are aware of it, but some of the 430's had a bad ground connection on the PA ciccuit board which would ultimately cause the loss of the PA and driver stages. I don't recall where exactly, but the fix was a short piece of strap from the PA ckt board to chassis ground.

For what it's worth, all two of the different Panasonic disk drives
I have worked with identify themselves as MATSHITA (sic) in the
8-character _Vendor Identification_ field of the SCSI Inquiry Data message.

The Matsushita publication "SCSI Interface Specification" for the drive
confirms this 8-character word.

One other suggestion:

Radio Shack sells a box that takes two video inputs, one from channel 3/4 the other from direct video and audio inputs (mono) and puts them up on around TV channels 18 and 66. These don't conflict with cable channels of the same number. I get better video that when I tried to mixed things around channel 3 and without all the bleed over problems as well.

I've seen older, cheaper boxes than do band translation, but these babies tend to self oscillate and radiate execessive amounts of broad-band RF in all the wrong places.

I use one channel for VCR output and the other for a baby room b/w monitor and it works fine as long as you can master the cable/tv (rf) button on the TV. I mix everthing and then distribute it to the entire house.

The frequencies and modes should be documented in the repeater directory,
co-ordination gives legitimacy in disputes.

On another note, we need to adopt a "highest and best use" philosophy
on co-ordination --- i.e. a public service club with large membership should
get precedance for a repeater pair, before 2 people who want a private
repeater to yak 10 minutes a day on the way to work whent hey could easily
operate simplex, or use a shared repeater.

Hey, gang!

I'm looking for info on some (allegedly possible) modifications to the Uniden/Bearcat BC200XLT scanner. Specifically, I'd like to know how to:

* Restore cellular freqs (currently not available)

* Increase scanning speed

* Turn off the low-battery safety shutoff "feature"

I have been told that Grove Electronics sent out instructions for these mods to their customers; my local radio dealer didn't. Can anyone out there tell me if these mods are indeed possible, and if so, how to accomplish them?

Please reply by email to RPH0470@TNTECH.BITNET, or snail-mail to:

> differentiate. Discrimination is wrong, whatever the reason given.

This isn't discrimination. Age, sex, ethnicity are things a person can't
change. That's why decisions based on those factors are called discrimination.
Smoking is something a person can control. It falls in a similar category
to the person's attitude towards his customers.

You wouldn't want to do business with someone who was rude or arrogant, would
you? Well, I consider smoking a form of rudeness. That person obviously
has little concern for how his actions affect other people. Now maybe you
don't find the smoke bothersome, but I (and many other people) do, and I
personally would rather hold my breath than breathe that crap in.

Many of the open-frame switcher supplies will run from 220 volts
too, and they don't care what the input freq is. One thing to
worry about is they have a MINIMUM load spec.

As for a brand, well, there's ACDC, Power One, Pomer Mate, and a
zillion others. Try your local surplus house, or the one listed
in the FAQ list here, too.

>My comments are based on the 2 radios in our family, and a friend's radio.
>I wrote a response to QST about the comment on the weak battery connection
>and I believe we agreed to disagree,

I've had my F1T for 8 months of rough and tumble usage, and have never had a problem with the battery connections (physical or electrical).
NOTE: If you open the radio up, make sure you slide the battery hooks over (like you were taking the battery off) to avoid bending the hooks.

>My radio has been dropped about a dozen times. It also fell out of my
>bike bag once and was drug by the coax attached to the antenna connector
>for about 50 yards starting at about 15 mph.
>My wife drops her radio so much I put a soft case on the unit
>to protect if from scratches. Of the 3 radios I am familiar with, none
>of them have experienced a failure. I consider the radio as tough
>as any on the market

It's tougher. That, and its size, is why many of the Alinco owners around here call it "the hand-granade".

>you need a belt clip for every battery and they don't come with the
>spare batteries,

I found that a CB-style mic hanger (a better quality, screw mount one) works great. The screw holes line up perfectly, and I just sqeezed it slightly in a vise to make it a little more flat. Then I bent the middle "finger" inward a little at the center so it would hold my belt (or jean pocket) a little tighter.

Don't pay Alinco's $3 or $4 for a fifty cent piece of metal.

>* The "MONI" function is brain dead. It is supposed to apply a repeater
>offset and open squelch so you can "Monitor Input" to a repeater and
>see if simplex is possible. None of Alinco's HTs do this. I guess they
>don't spend enough time playing with ICOM, Kenwood, and Yaesu before they
>build the clone.:-)

No no no! Hitting reverse (keypad 3) is for monitoring the input of the repeaters. Unfortunately, you would then be transmiting on the output of the repeater. Quite confusing to others listening to the repeater.

The MONI function is to open squelch regardless of the knob setting
or the (seldom-used) digital tone squelch.

>* The DTMF pad gets disabled if you use the handy remote mike that lets
>you change frequencies. The remote mic and DTMF are mutually exclusive
>which is kind of a pain. I would not recommend buying the remote mic, but
>get the regular mic.

Huh? Are you using the EMS-8 control speaker-mic? My F1T (serial #
2911) doesn't cut out the keypad when you connect the mic. Are your
serial numbers before or after mine? Does this cut out just the numeric
keypad, or upper buttons (call, v/m, scan, etc.)? What about the channel
knob on top?

Actually, I wish I could lock out just the numeric keypad at times.
I tend to hit the priority (keypad A) or thee DSQ (keypad D) on accident.
I'd use Freq Lock, but then I can't scan (unless I have the speaker mic on,
and hold down the up or down button).

>Given these few problems and all of the features you get for your money
>I highly recommend this radio to anyone wanting a small HT.

I couldn't agree with you more. In fact, I'll probably be picking up
another one for either my YL or my sister, whichever gets licensed first.
Nothing like a little friendly competition :)

3683. Sony PYXIS GPS receiver?

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-13 09:09:02 UTC
From: woods@glas.rtsg.mot.COM
Message-ID: <9210130908.AA20893@glas.rtsg.mot.com>
Source record: 284364

Hi,
As promised, a quick round-up of all the portable GPS units reviewed in September's Yachting World. This information is reproduced without their permission.

Sony Pyxis IPS-360:
4 channels, auto fix only, water resistant, no NMEA interface, 99 waypoints, dist/bearing to wp, speed, ETA at wp, XTE, track plotter, lock-on time 157 sec, battery life 20 MINUTES, price ST#725.
Case seems flimsy and fiddly. Useless without COG and SOG in my personal opinion (as distinct from Yachting World's).

Magellan NAV5000
5 channels, auto/2D/3D fix, waterproof, NMEA 0180/3, 100 waypoints, dist/bearing to wp, SOG and COG, ETA at WP, XTE, VMG, TTG, lock-on time 206 sec, batter life 1-2 hours, price ST#939.
Very robust. Allegedly floats if dropped in water.

Garmin GPS50
1 channel multiplexed to 8 sats, auto fix only, waterproof, NMEA 0810/2/3, 250 waypoints, d/b to wp, XTE, VMG and CMG to wp, ETA to wp, lock-on time 215 sec, cost ST#801.
Loads of extra features.

Trimble Ensign
3 channel, tracks 8 sats, auto/2D/3D fix, waterproof, no NMEA, 999 wp, SOG, COG, VMG, ETA, XTE dist/head, lock-on time 206sec, cost ST#695.
Very neat compact case. Apparently very power efficient.

Trimble TransPak II
6 channel, auto/2D/3D fix, waterproof, no NMEA, 999 wp, SOG, COG, d/b to wp, XTE, VMG, loc-on time 206 sec, cost ST#1095.
As used in Gulf War. Virtually indestructible. Rotary/toggle controls as distinct from buttons.

General notes (mine, not Yachting World's)
SOG=Speed Over Ground, COG=Course Over Ground, XTE=Cross Track Error, VMG=Voyage(??) Made Good, CMG=Course(??) Made Good. COG and SOG essential in my opinion. Garmin, Sony and Ensign units have XTE graph which you can steer by. Magellan, Sony and Transpacs generally accurate to within 100m or better. Garmin almost as good but ver occasionally plots outside 100m. Approx 30% of Ensign's plots are outside 100m circle around target.
All units bar Sony have an integrated antenna. The Sony GPS has a removable gimbal-mounted antenna.

The five-sided funny farm in their wisdom have deliberately
REDUCED the accuracy of GPS since the Gulf War, so the limiting
factor in getting a good fix is the signal from the satellites as
against the accuracy of the receiver in many cases. My personal
opinion would be not to trust ANY unit as being accurate to less
than 100m.
So there you go. Take your pick. I am not endorsing any part-
icular product but I think this review bears out previous posts
as regards negative feelings on the Sony and favourable comments
on the Ensign, Magellan and Garmin units. I have not used any of
these units (my only experience is with a Raytheon GPS) so feel
free to take my comments with a pinch of salt if you like.
Cheers,
Simon Woodworth.

SOG=Speed Over Ground, COG=Course Over Ground, XTE=Cross Track Error, VMG=Voyage(??) Made Good, CMG=Course(??) Made Good. COG and SOG essential in my opinion. Garmin, Sony and Ensign units have XTE graph which you can steer by. Magellan, Sony and Transpacs generally accurate to within 100m or better. Garmin almost as good but ver occasionally plots outside 100m. Approx 30% of Ensign's plots are outside 100m circle around target.
All units bar Sony have an integrated antenna. The Sony GPS has a removable gimbal-mounted antenna.

The five-sided funny farm in their wisdom have deliberately
REDUCED the accuracy of GPS since the Gulf War, so the limiting
factor in getting a good fix is the signal from the satellites as
against the accuracy of the receiver in many cases. My personal
opinion would be not to trust ANY unit as being accurate to less
than 100m.
So there you go. Take your pick. I am not endorsing any part-
icular product but I think this review bears out previous posts
as regards negative feelings on the Sony and favourable comments
on the Ensign, Magellan and Garmin units. I have not used any of
these units (my only experience is with a Raytheon GPS) so feel
free to take my comments with a pinch of salt if you like.
Cheers,
Simon Woodworth.

3685. Discrimination (?)

Newsgroup: rec.radio.amateur.misc

Over the past several months I have noticed the use of the term Discrimination to rebut a person's opinion. Why is it that everyone is so concerned with this? Why is it wrong to form an opinion based upon one's personal like or dislike? Does this mean that one has to conform to some quasi-standard setup by a person or group?

Oh boy, oh boy, a spelling flame! I checked with the online dictionary
and it corrected my spelling of "labelling" to "labeling". Not content
to accept the word of a computer, however, I went to the big book on
the stand. It says the single 'l' is the preferred spelling and notes
that the 'll' is a britishism. (yes, small 'b')

>5/8 wave roof-mounted vertical? More than a dipole in free-space? :)

I'm going to make like QST and not publish any db figures. Just let me say that I used to be a confirmed Larsen user, but now I use Comet antennas. Better performance in a smaller package. Amazing really that their little cellular lookalike dual bander outperforms the bigger Larsen dual bander on the same mount.

My repeater now uses a Comet antenna instead of a DB Products clone, and grade A coverage has improved by 15-20 miles. I took one apart to see what the magic was, but couldn't find any. It's just a bunch of 1/2 wave sections close stacked together in a fiberglass tube, but it sure works. I *think* it may have some needed electrical beam tilt, the repeater is 970 feet above ground, but don't have a range to confirm that precisely. I do know it has survived direct lightning hits and 70 MPH winds in the two years it's been up.

I have a 2x4Max at the base station, and it has also been a sterling performer. It's better than the Diamonds, Isopoles, and Ringos that were tried before, it's even better than a G7. I've only heard of one complaint. A friend got a Japanese market model 2m Comet on the grey market and it wouldn't tune above 147 Mhz. The $15 he saved turned out not to be a savings at all.

>change. That's why decisions based on those factors are called discrimination.
>Smoking is something a person can control. It falls in a similar category
>to the person's attitude towards his customers.

discrimination: to act on the basis of prejudice
prejudice: an adverse judgment or opinion formed beforehand
or without knowledge or examination of the facts.

At least that is how the dictionary I have defines these terms.
Whether or not prejudice is as a result of optional behavior is
not a factor. Would you consider discrimination against a person
who was disabled as a result of optional behavior, eg a motorcycle
accident, acceptable? Same arguments about religion, ie it is an
optional behavior.

In general, people will find both myself and my family in the
non smoking part of airplanes, restaurants, etc. OTOH, we don't
walk out of a restaurant if a seat in nonsmoking is unavailable.
We do this less out of a tolerance for smoke, but for a tolerance
of *people*. If we all had a bit more tolerance for the next guy
over, we might have a few less antenna ordinances :-)

BTW, we would tolerate you habit of holding your breath when the
first wisp of cigarette smoke passed by and probably would even
accommodate your habit of passing out for lack of oxygen ;-) ;-)

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 081 (OPDX.081)
October 12, 1992
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, DXNL, DF4RD, KE2LJ, N2DBI, WB3LHD, WB3JFS, W3OTC, IK5AAX, IS0JMA, JH1FDP, ON4VT, WA8MEM and KF8VW for the following DX information.

5R8, MALAGASCAR. Hideki, JH8JWF, will be active from October 22-27, on all bands and CW/SSB/RTTY. He will be active during the CQ WW DX SSB Contest as 14 MHz SSB Single Band category only. His call sign is unknown at this time.

9A, CROATIA. Erik, ON5AI, will be QRV as 9A/ON5AI begining on October 24, and staying until May 1993. Erik belongs to the Belgian UN "Blue Helmet" forces controlling the peace in 9A-land. He will be active on all bands operasting CW/SSB. A special QSL card will be available via Box 45, Kasterlee 2460 Belgium.

9M6, EAST MALAYSIA (CANCELED). Yutaka, JA9AG, was on his way to the airport for his 9M6 DXpedition when he was involved in a traffic accident in a highway tunnel. The report stated he is in the hospital now, but his injuries were not severe. He is only sad because he can not make the trip.

ET, ETHIOPIA. Two stations became active this week, ET3BC and ET3YL. The operators seem to be Carl and Martha Henson. They have been heard on 15 (21295), 20 (14200, 14245) and 40 meters (7011 kHz). Their length of stay is unknown at this time. QSLs for ET3BC (Carl) go to K4PHE and ET3YL (Martha) go to N4NX.

FG, GUADELOUPE. Jim, W6JKV, expects to be active as FG/W6JKV from about October 23 to November 9. Activity will be on 6 meters SSB/CW and on 2 meters EME with a monsters 54 ft. long yagi. For the latest information on this operation and other 6 meter activity listen to 28885 kHz.

IM0, PEDONA ISLAND. Roberto, IS0JMA, should be active as IM0/IS0JMA until October 24th. Pedona Island has an IOTA of EU-024. Activity will be on HF and VHF. QSL via IS0JMA. His next stop will be Marinella Island on the 25th.

J3, GRENADA. Four operators from 8-land will be active from October 21 thru the 27. They will be active as Multi-Single during the CQ WW DX SSB Contest as J37L. Outside the contest, they will be active on all bands,

CW/SSB as: J3/WD8MQJ (Ed,WD8MQJ), J37C (Walter, K8CV), J37E (Ed, NY8E) and J37L (Ron, WA8LOW). QSL via W8 Bureau.

JD, MINAMI TORISHIMA. JK1ABP will be active from October 14 to January 14, 1993. Operations will be all bands on SSB/CW/Packet. The callsigns will be JA9IPX/JD1 or JK1ABP/JD1 (WARC only).

OY, FAROE ISLAND. OY2VO has been active on 28420 kHz around 1354 and on 21349 kHz around 1700z. QSL via OZ9DP or via the Bureau. Also, OY1HJ has been active on 14226 kHz around 2155z.

RTTY ACTIVITY. 3C1EA 14088/0645z, 9M6HF 14079/1719z, 9Y4VU 28092/1653z, CN8NP 14078/0636z (ARQ), FR5FI 14088/1718z, GM0ILB (S.Shetland Island) 21090/1803z, JX9EAH 14088/1726z QSL via LA2T, OH1AF/OJ0 14085/1940 and GJ3YHU 14089/1025z.

S2, BANGLADESH. JA operators (JO3XEQ, JO3XER and JH7DHS) will be active as S21U from October 10 to 18. Activity will be 160 thru 6 meters on SSB/CW/RTTY. Suggested frequencies: TX 1824 RX 1910, 3511, 3799, 28495 and 29260 (FM).

TI9, COCOS ISLAND. Jose, TI2JJP, says everything is on schedule for TI9JJP to start on November 1 and end on November 11. This DXpedition will operate on SSB and RTTY only. There will be activity on 10, 15, 20 with a possibility of 75 meter. QSL via TI2AOC.

VU7, LACCADIVES ISLANDS. Just a reminder! Vidi, VU2DVP, and others will be active probably around 2000z on October 17 until October 24. They are going to operate mostly on the satellites, but may operate some HF. The HF activity may be on 20 meters, possibly on some of the DX nets.

XT, BURKINA FASO. Bob, WB2YQH, states XT2BW is now up and running RTTY. He can be found on 28073 kHz around 2156z. Bob mentioned that XT2BW is having a little trouble with his tones, but hopes to have it straightend out soon. QSL via WB2YQH.

ZL7, CHATHAM ISLANDS. Word is going around that Ron, ZL1AMO, may make a trip to Chatham before the end of the month.

DX TIDBITS..... 9D0RR cards are now being received. Ed, NT2X, was able to acquire some volunteer helpers in the Tri-State area to help process the cards..... People in the Midwest are reporting they are receiving S2/ and EP/ HA5BUS cards..... There has also been reports of YX0AI cards arriving..... OE6CRD holds the logs for YI1BGD (since 1989) and YI1RJ. For confirmation, write to: Christian Steger, OE6CRD, Haus Nr. 104, A-8132 Pernegg, Austria..... S21ZA are still being received..... JR1SSH has reported receiving his OK1DTG/P5..... NODXA member Bill, W8JGU, was active from Big Pine Key (NA-062) as 1P0/W8JGU. For a QSL send a SASE to his CBA....

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with

Message-ID: <1992Oct13.143356.3908@news.acns.nwu.edu>
Source record: 284369

This is a copy of a letter that 36 members in my club sent to our
ARRL Division Director today. Please feel free to excerpt part
or all of it for exhorting your Director to vote for amending
the sub-band allocations listed in Appendix B of Digital
Committee's Sept 26 report.

Rajiv
aa9ch
Address: r-dewan@nwu.edu
Phone: None. Only CW.
And AMTOR occasionally.

Director, Division
American Radio Relay League October 12, 1992

Re: Digital Committee's 160m and 30m Packet Sub-band Proposal

Dear Mr. :

We are concerned about the subbands for unattended automatic HF Packet in
the Digital Committee's proposal, Appendix B, dated October 1992. The
Committee proposes subbands in all nine HF bands for unattended automatic
packet operation. While we applaud the Committee's efforts in sorting out the
HF Packet operations, we take issue with two of the subbands selected, one in
the 160m band and the other in the 30m band.

For many generations and in long lived Amateur Radio tradition, the bottom
portion of the Top Band has been devoted to CW operations. Most of the CW
activity in this, the most elegant of all of the HF the bands, the 160m band,
takes place between 1.800 and 1.840MHz. And yet, the Digital Committee
proposes a subband of 1.810 to 1.820MHz for unattended automatic packet
operation. We think that this is incompatible with Amateur Radio tradition.
It breaks up the narrow segment that has become the hub of CW activity in the
160m band and proposes to devote a full 25% of it to unattended automatic
packet. We think that this is unacceptable. Can not the Committee find a
10KHz subband else where in the 160m band? Does it have to be right in the
middle the most CW active portion of the band?

The 30m band is a refuge for all non-contesting CW operators and a haven for
low power CW operators. The Committee recommends a 10.140 to 10.150MHz
subband, a whopping 20% of the complete band, for unattended automatic packet.
Low power and lack of contesting make this band special. Do we have to devote
20% of this interesting band to unattended automatic packet? Can we not let a
Radio amateur tapping out CW, which is `attended' and `non-automatic', take
precedence over a background and robotic task of transferring ALLUSA bulletins

over HF packet? Let us leave this band alone and move out the robots to other bands.

When this comes up in the ARRL Director's meeting, we request you to move for an amendment to the subbands proposed by the Committee that moves the 160m subband out of the 1.810 to 1.840MHz segment and deletes the 30m subband. If this cannot be done, we request you to vote NO to the proposal.

Signatures.

>the attachments which are nailed or screwed through the shingles:
>how do you prevent the holes from leaking.

Lots of sealing goop. Check at your local hardware store.
>
I've mounted antennas in two ways using RS stuff. Heavy antennas I've
mounted using one of their 20' push-up masts, a ground anchor plate and
two stand-off brackets that hold the mast and screw into the siding. This
held my 2M beam through many storms. The load goes straight down to the
ground and the brackets only handle wind load.

Lighter antennas, like a Ringo, I attached using only the brackets and
a short length of RS TV mast.

Here's what I came up with to serve a dual purpose; a place to mount a vertical antenna and provide an easy, neat weatherproof entry for the feed. I used a 3 foot long piece of 1 1/2 inch EMT pipe through the roof and attached to the truss with 1 1/2 inch EMT hangers. I sealed it with an appropriate vent pipe flashing (consult a roofing book or professional on how to seal this properly.) Top the EMT with an electrical service entry hood and attach your antenna with appropriate clamps to the EMT. Run the feed down through the EMT into the attic and then into your shack. You can then use it to feed other antennas on your roof also. 1 1/2 inch EMT should be able to pass about 5 RG-8 cables easily. Works great and is very sturdy. I wouldn't recommend hanging a big HF beam on it though... Don't forget lightning protection...

Message-ID: <1992Oct13.103808.43811@kuhub.cc.ukans.edu>
Source record: 284377

I've had an Alinco DJ-F1T for almost a year (serial # somewhere in the 700's), and I have very few complaints about it. My battery pack has never released accidentally, not even while the radio was bashed around on the rocks while on my belt during a climb in Colorado. The audio quality is superb, compared with other HT's in my local radio club. I get a lot of use out of a single charge on the battery pack, thanks to the battery-save mode. I'm a little concerned that the soft keypad buttons might wear off someday, since I carry the radio around in a canvas briefcase most of the time.

All in all, I'm quite satisfied.

Jim- I had a similar "flakey" problem with my BC300 about 3 years ago. I sent it to Uniden and they fixed it. They charged me a flat cost of $75, and they replaced the entire front panet circuit board. I'm sure that board cost alot more than the $75 I spent. Plus, they rewired the main board; probably to bring it up to date. The thing has never worked better, and it's been working great ever since. If you want, I'll sell you mine; make me an offer. :)

Good luck

Date: 1992-10-13 15:57:22 UTC
From: jbloom@arrl.org
Message-ID: <626@arrl.org>
Source record: 284183
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet

We're trying out a new service. We've made available a number of
text files containing information about various facets of Amateur
Radio. You can retrieve these files selectively by sending an
email message to ARRL HQ. Each file you request is then mailed to
you automatically, usually within a few hours.

Here are copies of the current "help" and "index" responses of
the info mail server. They should get you started. Enjoy!
==========
INFO is a service of ARRL HQ. To use it, mail messages to:
info@arrl.org
Each line of the message should contain a command as shown below.
You may place as many commands in a message as you want. Each file
you request will be sent to you in a separate message. Only ASCII
text files are supported at present.

Valid INFO commands:

help Sends this help file
index Sends an index of the files available from INFO
send file Sends the specified file
quit Terminates the transaction (use this is you have
a signature or other text at the end of the message.)

73 de ARRL HQ
==========
Files available from INFO:

FILENAME DESCRIPTION
--- ---
bioeffects Information about RF safety
email List of HQ Email addresses
emi-gen How to solve an EMI/RFI problem

3701. using cheaper car batteries

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-13 16:04:57 UTC
From: rtaylor@ux1.cso.uiuc.edu
Message-ID: <Bw2I0o.3or@ux1.cso.uiuc.edu>
Source record: 284279

If you are using a standard car battery to power a transceiver as I did
for many years, put a computer 12 volt, 3 amp. power supply across it.
Set the voltage output for 13.6 volts or whatever voltage you think your
battery likes better. The power supply will provide all the current
on recieve and part on transmit. The battery only supplies peak current
for transmit. With the voltage regulated PS, you won't overcharge the
battery. Since there is no deep discharge, unless you talk for 24 hours
straight without receiving, the car battery does just fine and will last
for many years. You will probably have to clean the terminals occasionally.

There is a coax stripper and crimper toolset that works very well from a company called Phase 2 Technologies. They have an add in the October issue of QST on page 134 (I think).. sorry, I don't have the number with me...

Good Luck

What category do beliefs fall in? (ie: Religion, Politics, All hams should
learn CW at 20wpm, etc.)
Beliefs can be changed, therefore one can discriminate based on them, right?

Or how about personal preferences or esthetics? Now maybe you don't find the
odor of cooking fish (fill in your own particular obnoxious item here)
bothersome, but I (and many other people) do, and I personally would rather
hold my breath than breathe that crap in. ;-)

It's not a personal issue, it's a matter of good judgement. Have
you ever looked inside a two-way radio used by dispatchers for a
few years where smoking is allowed? I've seen chassies that
looked like they were plated in copper, just from the smoke
residue.

Now, you can buy YOUR equipment and components from a smoke-filled
warehouse. I prefer mine to be undamaged.

>
.....? What is meant by "auto fix" versus the auto/2d/3d you mention for
others? The GPS 50 will automatically switch between 2d and 3d fixes
depending on the number and quality of received sats. Apparently in
the 2d mode it uses the last 3d altitude to help in the fix, and is
supposed to allow manual entry of an altitude for increased accuracy, but
I have never tried this myself........

> Ensign's plots are outside 100m circle around target.

I hooked the serial output of my GPS50 to a laptop computer, and
graphed the position for almost 24 hours. The result was a fairly
tight random walk, which would have been within a 100 M precision, except
for two occasions during the 24 hour period, where apparently it had a hard
time with the sat positions, and the position went considerably out of the
circle (probably 500 - 800 M) for less than 1/2 minute. There were probably
periods when the position was not plotted at all, when it didn't have a
fix at all (the above mentioned excursions were probably just before it
lost its fix).

> All units bar Sony have an integrated antenna. The Sony GPS
> has a removable gimbal-mounted antenna.

The Garmin GPS50 has a detachable antenna (BNC connection). Also,
the Magellan advertises that an external antenna can be used. I clip the

antenna to the base of one of those rain gutter cb antenna mounts on my car.

> The five-sided funny farm in their wisdom have deliberately

> opinion would be not to trust ANY unit as being accurate to less
> than 100m.

Probably true.

Is there any way to tell when they are degrading the accuracy? The GPS50 calculates what it "THINKS" its accuracy is, and I was curious whether it can sense whether the DOD degrading is on or off, or if it is being fooled.

3714. Radio Shack Discone any good for ham?

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-13 19:45:45 UTC
From: pas@jupitercmc.ca
Message-ID: <1992Oct13.194545.20839@venus.ic.cmc.ca>
Source record: 284308

TOPIC: Radio Shack Discone any good for HAM?

Hi. I have a Pro-2006 scanner which I want to equip with
a better antenna than the telescoping whip. I'm prepared
to mount something on the roof of my house to do the job.
Sometime in the near future I plan to get my amateur license
and buy a handheld transceiver. I notice Radio Shack sells
a Discone antenna that works from 100 Mhz to 1Ghz and can
also be used to transmit up to 200 watts in the 140 and
440 amateur bands. I suspect this antenna is a reasonable
one for my scanner (as far as all purpose wide band antennas go).
My question is: how does it fair as a amateur radio antenna?
Is it of the total joke, casual hobbyist or serious hobbyist
category?

Thanks in advance for any advice on this.

Peter

3716. Re: FRAUD ALERT - CD-ROM vendor

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-13 20:26:16 UTC
From: andrew@frip.WV.TEK.COM
Message-ID: <1962@shaman.wv.tek.com>
Source record: 284290
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,alt.cd-rom,misc.consumers

Jon Gefaell is poorly informed on consumer law:

"You can return ANYTHING within 30 days and pay nothing. All
you need do is call your credit card company, indicate that you
are 'unsatisfied' with your purchase. You can return ANYTHING
within 30 days and pay nothing. All you need do is call your
credit card company, indicate that you are 'unsatisfied' with
your purchase. Then ship the offending item back to the vendor,
get a shipping receipt (insure the package optionaly, I send it
back COD) and mail a copy of the purchase and return shipping
receipt."

There is nothing in the law or in the credit card banks' regulations
that requires a merchant to comply with this scenario. Perhaps Jon is
confused about the "failure to perform" clause, under which you can
contest a credit card charge if you never got the merchandise in the
first place.

"This is federal law. This is why direct marketing (mail order)
ALWAYS offers '30 days satisfaction guarantee!' It's Federal
Credit Law."

No, it's not. And many mail order merchants don't offer this guarantee.
They don't have to. Perhaps Jon is thinking of the FTC regulation
requiring shipment within thirty days of payment. But once the
consumer has received the merchandise, the FTC bows out.

"Common sense will avoid these sad stories as we've read here.
Protect your rights!"

Indeed. Begin by understanding those rights.

The dangers of a car battery is that when charging, it emits
hydrogen gas.

Hydrogen is colorless, odorless and wont poison you.

Problem it is REAL flammable.

I would suggest charging the barttery in the garage or outside, keep
sparkes and flames away from it, that INCLUDES cigerratte smoking.

This is not to give the impression that they are REAL dangrous, but
one should take reasonable precautions.

There is also acid in them, if it leaks or is spilled, you will destroy

This will have little or no effect. The problem is that a resistive divider volume control needs to drive a very high impedance stage. An 8 ohm head set does not qualify! You would need to use a "T-Pad" to make this work properly.

Actually all they needed to do was add one more transistor...

> PS. I don't smoke, no one in my house smokes, etc.

When the mode of dress of the folks I do business with has a direct impact on my health, yes, I will stop doing business with them.

When their choice in cars requires me to come home, throw everything I'm wearing into the laundry and throw myself into the shower to get the air around me to a point where I can breathe again, yes, I will stop doing business with them.

When their personal habits stick to their merchandise so strongly that I have to leave it outside to air out for a day or two before I can use it, yes, I stop doing business with them.

I stopped doing business with Tel-Com because I couldn't breathe in their shop. If the smoking at Rivendell continues, I will be forced to stop doing business with them for the same reason.

It's not a matter of tolerance, believe me...

Faith N1JIT

p.s. glad to hear you don't smoke!

Bingo and Amen--

Please also note that Faith is NOT insisting that those folks stop smoking--

My attitude is similar--I will depart a store or other business if there is heavy smoling going on--and the best way to get me to buy a used anything is to note that the owner is an non-smoker. I despise cleaning dead tobacco smoke out of anything--I had enough of that in the Navy in the 70's.

BTW, your place, your rules, my place, my rules--we don't allow smoking in our house either--not even my dear 3 pack-a-day mother (Who has the grace to not complain).

I don't condemm the person that is addicted to tobacco--I merely avoid the necessity to inhale that stuff (politely, I hope). I am badly affected physically by the smoke--I simply cannot breathe properly if I am exposed to smoke--I'm sure this is from damage to my lungs from being brought up in a home with parents that went through 2-3 packs/day EACH.

I have always been able to quietly be sure the wind is blowing the smoke away from me. A polite reguest normally stops the problem. Of course, those that insist don't get invited back---

I think you may be expecting too much from something in that price range.
As the technician for 60+ school video systems, I have discovered that the
most expensive single piece of equipment I ever buy is a single channel
elimination (notch) filter or bandpass filter. Amplifiers are cheap in
comparison. A Blonder-Tongue CEF is about a thousand dollars as I recall.
And a BPFa should be in the same range. And to do this right you would need
one of each. That's 57db rejection on the notch and 70 db on the bandpass
meaning 57db for the two. Not what you had in mind.
Adjacent channel interference is a bear, particularly 3 and 4. If you can use
channel four you will be better off because of the 4MHZ separation between it
and channel 5. If the device will let you set levels, keep the audio carrier
down to the minimum necessary - it bleeds over the most; and use only enough rf
to give you decent video. Anything over 6db at the TV input (0dbmv is what
it's designed for) is wasted and too much rf input is every bit as bad as too
little to a TV set. I have seen techs set rf by eye rather than meter and
add rf to an already overloaded system.
If the bleed is coming the other way, i.e. the cable signals overwhelming
your converter; you might try using a vhf hi-lo splitter and just drop
everything below channel six when using the converter. They are as cheap as
a filter can get, but you are still looking at $25-$60 depending on quality.
BTW, ground well -- that seems to be a very fragile component in thunderstorms.

That would be Blonder-tongue MLHF. the split is dc-108 (ch6 upper end) and
174 to 300 (fmband to upper cable). The separarion is 28db.

Most of the "quality" and accuracy calculations I have seen with respect
to GPS concern the number of satellites in view and their orientation
relative to the observer. The same calculations are made (and displayed)
with "spoofing" enabled or disabled.

>K9ALD

An even cheaper alternative exists, one with some useful advantages, i.e. inst
ant recharge. At least one natonal auto mail order company offers a miracle goo
that you just squeeze into each cell of your battery. This goo is notihng more
than concentrated sulfuric acid, H2SO4, avaliable from any high school or coll
ege chemistry lab, or from your local chemical supply house. A few millilitres
of 10M (concentration in moles/liter) of this stuff in each of the cells of an
unsealed lead-acid battery will recharge it. The stronger the molarity M acid y
ou use, the least you need to use. AT least theoretically, if you used enough a
cid at the right concentration, you wouldnt even need to charge it!!!!! just a
quick burst of charge... 10-20 mins to get the electrolyte flowing agian......
You should be able to pick this stuff up for a few bucks, or even free. Try to
get about 1 litre (quart) of the stuff at about 10M concentration.

Dont come crying to me if this doesnt work or if something goes wrong. I used t
his procedure to keep my car battery for about an extra year (starvin'college s
tudents will do anything to save $$$) *WARNING* sulfuric acid is highly corros
ive.... do this in open air and always add the acid slowly and in small amounts
to the battery cells. DO NOT GET IT ON ANYTHING!!!! if you do rinse it off tho
uroughly with water and baking soda. if you get burned by it, you didnt hear ab
out this from me.

If youre interseted, the chemistry involved is mighty simple. In a discharged b
attery the sulfuric acid has formed lead sulfate on the lead plates of the batt
ery, leaving water as the electrolyte. Adding acid can reverse this process. Th
is will even work for a totally "dead" battery or one that has no electrolyte i
n it.... at least it should. By adding te acid, you allow the sulfate to go bac
k into acid, and the battery can be recharged. Trickle charge it at first .

This presents some interesting possibilities to the field day or emergency oper
ator. At least theoretically :), you can add theright amount of acid to a disch
arged battery and INSTANTLY recharge it.. kinda nice when you need 50 more qso

's and you have a dead battery.... I dont reccomend this more than a few times, because too much acid will just destroy the battery quickly. In an emergency, however..... GOOD LUCK AND BE CAREFUL. I assume no responsibility for you or your battery...

Simon, "pa.dec.com!rdg.dec.com!forsan.enet.dec.com!frenchs@decwrl.dec.com", comments:
> Regarding GPS,
> The Ensign Trimble has the added function of giving your location in
> Ordanance Survey Grid Reference (in British Isles)

I met Art Lange, W6RXQ, at W6JKV's recent barbeque. Art is a/the marketing man for Trimble's more expensive GPS receivers, not the Ensign. Because of Art's VHF interests, he has been able to get ham Grid Squares in the Trimble units he markets, but has been unable to convince the powers-that-be at Trimble that it is worth their while to put ham Grid Squares (Maidenhead for you Europeans) in the Ensign. He strongly urges everyone who cares to write Trimble management asking for ham Grid Squares in the Ensign.

With the great precision of GPS, Art has extended the Maidenhead Grid Squares to many more than the 4 (or 6) characters in common use by hams. He calls them Trimble Grid Squares, but they are the same as we hams use for at least the first 6 characters.

Regarding "Selective Availability" (SA = intentional accuracy reduction), I gather that the GPS manufacturers aren't about to rock the boat, since their big-money contracts come from the military. Apparently the automobile manufacturers are getting interested in GPS. Perhaps they will also get interested in elimination of "SA".

>>has submitted to ARRL via their MCI account.
>Perhaps one suggestion would be for us to always send an acknowledgment,

One thing that should be pointed out is that to reply to a message on
MCI Mail normally costs about 45 cents, unless you are using a
preferred pricing option where it becomes 25 cents for the first 40
messages sent. So it makes sense that the ARRL will reply by either
electronic mail or postal mail, but not both.

I have ALWAYS received a postal reply to anything I have sent to
the MCI Mailbox. This response normally came back to me within
8 days, which is not unreasonable. For those requests that require
written response, you should wait for a couple of weeks
before sending another request via e-mail. And like mentioned above,
your request may be sent to someone who is unable to respond via
electronic mail.

I've had good luck with sending messages to the MCI Mailbox, and even
to my Division Director, who did reply to me once using e-mail.
I do know that sending mail back through the gateway from MCI Mail
to the Internet is usually more complicated than the other way around,
especially for those using uucp addresses.

AAAAAAKKKKK... Wrong answer. Thank you for playing.

What about the "private" repeater group with several hundred members?
Is this really fair to those several hundred as opposed to the "club"
with several hundred members who run a "public" repeater?

I think not.

3740. Motorola Minitor help needed

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-14 04:55:05 UTC
From: mwgordon@nyx.cs.du.edu
Message-ID: <1992Oct14.045505.15076@mnemosyne.cs.du.edu>
Source record: 284315

I recently picked up a couple Motorla Minitor pagers at a fest, and I have a whole lot of qustions about them. I hope someone out here on the net can help.

Who has the lowest price on the tone reeds? Motorola wants $45 per reed, which is assinine.
These pagers are the "3 tone" ones. They take 3 reeds to allow the pagers to decode 2 different paging tones. It was explained that this is for rescue/fire or battalion/department type combinations. According to the guy I bought the units from, one reed is the common first tone between the 2 pages. Does anyone have more info on this? If the numbers on the pager are 215 and 212, is the common tone a "2" or a "21"? How are the reeds numbered? How is the common reed different than the individual reads? Neither of the pagers has any reeds in them, which socket is for the common reed?
The organization I'm setting these up for is a small self-funded transport service for disabled university students. We're going to hook a paging encoder onto our business band base station so that riders can call in and page a driver to pick them up. This system will be used on weekends and late at night, when we don't have a dispatcher. Does anyone know of an encoder that interfaces with the phone system and costs less than $1000? Being that we're self-funded, it's hard to come up with that kind of money to support 2 pagers (no matter how important they are).
Unfortunately, neither of chargers I got are working. One is a regular charger, and one has an audio amp and external antenna. Neither of them wants to put out a constant voltage. They fluctuate between about 5 and .5 volts. Each time I put the voltmeter on the charging contacts, the voltage is different, but it does hold to that volage until I take the leads off. Voltage regulator? Capacitors? Any ideas?

Any help would be GREATLY appreciated.

SB SPCL ARL ARLX037
ARLX037 DXAC voting

The ARRL DX Advisory Committee (DXAC) has voted not to pursue the
following items:

1. Changing the DXCC country status of former USSR republics. (2 Yes
14 No)

2. Consideration of a DXCC rules revision to permit participation by
stations located on board docked ships in ARRL Awards Programs. (3
Yes 13 No)

3. A study of an advanced DXCC Award. (3 Yes 12 No)

4. Changing the DXCC country status of 4U1VIC. (3 Yes 13 No)

These items have been removed from the DXAC agenda. No further
action will be taken at this time.

SB SPCL ARL ARLX036
ARLX036 DXAC recommendations

The ARRL DX Advisory Committee (DXAC) has voted to recommend the
following additions to the DXCC countries list:

Croatia 9A (was YU2) 15 to 1
Slovenia S5 (was YU3) 15 to 1
Bosnia-Hercegovina YU4 13 to 3
Macedonia YU5 12 to 4

The DXAC intends for the entity of Yugoslavia to continue on the
list. This entity is composed of Serbia (YU1), Montenegro (YU6),
Vojvodina (YU7) and Kosovo (YU8).

These recommendations now go to the ARRL Awards Committee for
consideration. Start dates will be announced after Awards
Committee action. Please, do not send QSL cards to the DXCC Desk
for these countries until they have been offically addes to the
list and a date for acceptance has been announced.

Some local guys just left to Br{nd|, Aland Islands to
activate OH0 on all hf-bands and all modes, including
some rtty also. They will be active also on satellites,
propably signing OH3TM/OH0 (op. Alpo), another call
in use will be OH3ES/OH0 (op. JOUKO).
QSLs via their homecalls.

>help in the fix, and is supposed to allow manual entry of an alt-
>itude for increased accuracy, but I have never tried this
>myself........

Auto fix only means the GPS unit will always try for a 3D fix if there are four satellites available and degrade to a 2D fix if there are only three satellites available. From a sailor's point of view, being able to force the unit to 2D fix all the time (as in the units I described as "auto/2D/3D") is useful because you're always at sea level and 2D fixing is faster. Using an "auto/2D/3D" unit just means you can force it into 2D or 3D mode all the time.

>The Garmin GPS50 has a detachable antenna (BNC connection).
>Also, the Magellan advertises that an external antenna can be
>used. I clip the antenna to the base of one of those rain gut-
>ter cb antenna mounts on my car.

You're right of course. In fact, the Magellan unit can be "docked" into a base unit which provides the external antenna connection and 12v DC power.

>Is there any way to tell when they are degrading the accuracy?
>The GPS50 calculates what it "THINKS" its accuracy is, and I
>was curious whether it can sense whether the DOD degrading is on
>or off, or if it is being fooled.

All the units in the original review display an HDOP value, either graphically, symbolically, or in feet/metres. Generally, the lower the HDOP value, the better the fix. I guess the user could guess the state of the DOD degrading by looking to see if there was a significant change in the HDOP value over a period of time.

I think I have heard mention of a system known as Differential GPS or D-GPS which is way more accurate than normal GPS. D-GPS works by setting up a land-based station which constantly calculates the difference between its actual position and its position as given by a GPS receiver. It then transmits a signal

which can be picked up by a D-GPS receiver and used to increase
the accuracy of a fix.

Cheers,
Simon Woodworth.

3748. re: MFJ 2 meter J pole

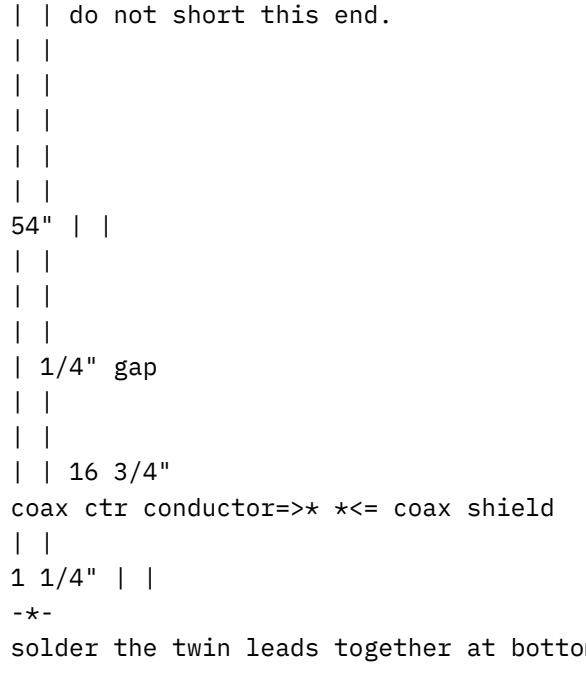
Newsgroup: rec.radio.amateur.misc
Date: 1992-10-14 10:10:46 UTC
From: little@nuts2u.enet.dec.com
Message-ID: <1992Oct14.081243.10032@nntpd2.cxo.dec.com>
Source record: 284326

If you mean that flexible J pole that they advertise in QST, build one yourself and save a few bucks. Here are plans for what should essentially be that antenna and the total cost should be under $5 (less if you can scrounge the connector and wire, i.e. free)

73,
Todd
N9MWB

2M Jpole with 300 ohm twin lead
>From: kinsman@ektools.UUCP (Andrew A. Kinsman)
Newsgroups: rec.ham-radio
Organization: Eastman Kodak, Dept. 47, Rochester NY

The following is a description of a J-Pole antenna made from 300 ohm TV twin-lead. Quite a few of the hams in the area have successfully built one or more of these antennas. They have quite a few advantages which include improved performance for 2-meter HTs, portability, and last, but never least, they are inexpensive.



1. Start with 54 1/2" of TV twin lead (foam core does not work as well)
2. Strip 1/2" of insulation at bottom and solder wires together.
3. Measure 1 1/4" from soldered wires and strip insulation on both sides. This is the solder point for a coax feedline.
4. Measure 16 3/4" from bottom and cut out 1/4" notch on one side.

5. Feed with a length of RG58U coax. Tape coax at feedpoint to the twin lead for strength and weather protection.

I have also attached an alligator clip to the plastic on the top of the antenna in order to conveniently hang it. I am successfully using one in my attic to avoid any CCNR problems. I have another that I can take with me camping, sailing, etc.

This design has appeared on many BBSs and in club newsletters; the earliest reference that I know of is a Jan. 1984 D.A.R.C. antenna article by James Burks, KA5QYV.

Enjoy,
N6UBM

All satellites transmit a "User Range Accuracy" figure, whether this includes
the effects of SA I don't know. Here is a listing I got from a Trimble
SVeeSix Plus receiver just before I posted this:

Ephemeris Status
SV Time collected Health IODE t oe Fit URA
2 Wed 11:09:12.000 00 BD Wed 10:51:44.000 0 32.0

19 Wed 7:23:48.000 00 61 Wed 6:51:44.000 0 32.0
20 Wed 5:38:48.000 00 DD Wed 4:51:44.000 0 2.8
21 Wed 11:24:12.000 00 0F Wed 12:00:00.000 0 32.0
23 Wed 10:39:12.000 00 71 Wed 12:00:00.000 0 32.0
24 Wed 4:53:48.000 00 31 Wed 6:00:00.000 0 32.0
25 Wed 6:39:18.000 00 6A Wed 8:00:00.000 0 32.0
26 Wed 8:38:48.000 00 24 Wed 10:00:00.000 0 32.0
27 Wed 9:09:06.000 00 01 Wed 10:00:00.000 0 32.0
28 Wed 11:09:12.000 00 36 Wed 12:00:00.000 0 32.0

The URA is coded in 4 bits in the satellite transmission & has been converted
for display into the value represented - given in metres. As you can
see, most quote accuracies of 32 metres with just a select few below this.
Perhaps this is what the GPS50 uses.

3751. Re: Slovenia S5 Prefix description

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-14 11:50:52 UTC
From: sharon@unixland.natick.ma.us
Message-ID: <1992Oct14.115052.17557@unixland.natick.ma.us>
Source record: 284180

Pete Hardie, VE5VA, posted the following:

>>In the comments on the results of the 1991 CQ WW DX SSB contest in Sept 92 CQ
>>it says that because DARC has already added them to the WAE list, Croatia
>>(9a1-9a0), Slovenia (S5) and Bosnia/Herzegovina (YU4/YT4/4N4) are separate
>>from Yugoslavia for the CQ contest. So make sure you add the other two as
>>well as S5!
>>Pete hardie@herald.usask.ca VE5VA

I would like to remind everyone that there is a horrible war raging all over Bosnia & Herzegovina. Most of the country is under constant heavy-artillery bombardment, the major cities are virtually without electricity, etc. :-(:-(:-(I highly doubt there will be a YU4 station on the air contesting. In fact, I doubt we'll hear any at all in North America.

They are still on and audible quite a bit in Europe, passing health & welfare traffic. Needless to say, it would be unconscienable to interrupt such activity to try to get a contest QSO. ... In short, I wouldn't expect to be able to work Bosnia for CQ WW. I certainly hope and pray that things will be a lot different there for next spring's contest season.

Tom, WB4IUX, then posted the following query:

>But what do we do about Macedonia? If the DARC already
>recognizes Yugoslavia, Bosnia, Croatia and Slovenia, why didn't they
>cover Macedonia I wonder????? Do we get to count that one too? If
>anyone knows please post. Thanks! Looks like we'll get some easy ones
>to up our 5BDXCC totals. 73, Tom WB4IUX

An interesting question. As you may know, Bosnia-Herzegovina, Croatia, and Slovenia have widespread recognition in the world as independent countries and are members of the United Nations General Assembly. Macedonia does not and is not, primarily because of Greek objections to the name "Macedonia" being used for an independent country that is not a part of Greece. Nevertheless, the DXCC Advisory Committee voted to recommend Macedonia for DXCC status along with BiH, Croatia, and Slovenia (the ARRL Awards Committee still needs to make the final decision).

I would be curious to hear the answer to that as well!

It is common (mis-)knowledge that secondary cigarette smoke is less bothersome
if a person sits in a red radio flyer wagon when the wheels are on oil soaked
rags, or.. better yet when standing on wood instead of concrete!! :-).

Source record: 284188
Cross-posted to: rec.radio.amateur.misc,rec.boats

I purchased a hand held marine radio made by Southern Marine Research (SMR) at the last flea market. The unit was supposedly in "perfect working condition" the last time the seller used it, the batteries "just died" so it could not be demonstrated" Well.... the unit is wasted! surprise, surprise.

The unit does not receive or transmit although the receiver seems to be functioning from the IF amp through the AF amp. It seems to be a problem with the PLL circuitry. There are 2 chips used: TC9122 and a D65IC02. I beleive thise chips decode the thumb wheel switches to control the VCO to produce the desired frequency. The VCO appears to be functioning but only static signals are observed on the TC9122 and D65IC02.

Does anyone have a pinout of either of these chips? Or better yet, does anyone have an address for Southern Marine Research ? I never heard of them. Any information appreciated.

3755. FCC Announces PCS Spectrum Grab

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-14 14:48:29 UTC
From: n2gj@phsbbs.princeton.nj.us
Message-ID: <iZ3msB1w164w@phsbbs.princeton.nj.us>
Source record: 284222

According to "Communications Week," September 28, 1992, the FCC has allocated three groups of frequencies in the 2 gigahertz spectrum for what it calls "emerging technologies." There are 22 MHz of bandwith in the new designation.

Among the new technologies cited in the announcement are such things as: voice and data services based on a personal communications service (PCS) network, and other wireless and mobile services.

According to the article, there are already "29,000 microwave links maintained by around 2,400 licensees in the three designated bands....[used] for both public and private microwave communications." It also states that Sen. Ernest Hollings (D-SC) had threatened legislation if the rights of the incumbent users were not protected.

The FCC has adopted a three year transition period and says that all users could have an equal claim on the spectrum "as long as there is no interference between operations." The government would prefer that conflicting parties "negotiate a voluntary relocation settlement." The only exemptions from this relocation plan are public safety, state and local government agencies.

In case you were wondering: the frequency bands are between 1.85 and 1.99 GHz, 2.11-2.15 GHz, and 2.16-2.2 GHz.

Does anyone have any details on whether an NPRM has been released, and the comment period dates? How could this affect amateur radio allocations in or near this spectrum? Am I dating myself when I remember back to a day when hams had all the spectrum above 1 GHz to experiment, since it was considered "worthless?"

3756. Cross band mods for 641A?

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-14 15:06:58 UTC
From: irving@booboo.Convergent.COM
Message-ID: <Bw49zn.8v8@booboo.Convergent.COM>
Source record: 284201

Can someone provide information about how to modify a Kenwood 641-A to add cross-band repeat. The 641-A is the tri-bander with 2m, 220, and an optional third band. At least one of the earlier versions of this radio style, the TM-941 (2m, 440, 1260), had cross-band repeat as a documented feature. However, it is not mentioned in the docs for the 641. Someone told me that they thought the feature was just disabled for some reason, and that the mod was simple to re-activate it.
Any info about this subject would be greatly appreciated.

Years ago, when I worked for a 2-way radio shop, I got a service call for a taxicab. This cab used a GE TPL radio which had progressively been losing its receive sensitivity. (If memory serves, TPL stands for Transistorized Progress Line, although we universally called it "Trash-Pile Line.") The radio was a hybrid tube/transistor unit that mounted on the transmission hump--right underneath the ashtray. To make a long story short, the receiver came back to life as soon as I blew out the one-inch layer of cigarette ash that had filtered through the vents atop the radio!

Well, you could make a Jpole using some twin lead and coax. I did this, and
it works well. Below is a copy of a file posted here some time ago, unedited:
(At least _I_ didn't edit it. :-) WA2ISE

--cut here and print the instructions that follow--

The following is a description of a J-Pole antenna made from 300 ohm
TV twin-lead. They have quite a few advantages which include improved
performance for HTs, portability, and low cost.

```
| | do not short this end.
| | (when trimming for vswr, cut both sides)
| |
| |
| |
3/4 | | Technically-speaking, this is a 1/2
wave | | wave end-fed antenna with a 1/4 wave
| | matching section.
| |
| 1/4" gap
| | (trim for vswr _below_ gap)
| | 1/4
| | wave
| |
coax ctr conductor=>* *<= coax shield
1 1/4"-| |
-*- solder the twin leads together at bottom
```

For a center frequency of 146 MHz:
1. Start with @54" of TV twin lead (flat, NOT foam core)
2. Strip 1/2" of insulation at bottom and solder wires together.
3. Measure 1 1/4" from soldered wires and strip insulation on both
sides. This is the solder point for a coax feedline.
4. Measure 16 3/4" from coax shield solder point and cut out 1/4" notch.
5. Measure 50 1/3" from coax center conductor solder point and trim
off twin lead at that point.
6. Feed with a length of RG58U coax. Tape coax at feedpoint to the
twin lead for strength and seal coax for weather protection.

To get the best possible match, in step three above simply MARK the "solder points" and measure from the mark for step 4 and 5. Now solder straight pins to your conductor and your shield. Insert the pins at the marked point and test for VSWR at the design frequency (146MHz). If necessary, probe up or down till you reach 1:1 (close as possible). Solder at the best points. To try this, you may want to start with the twin lead a little long and trim down to resonant length - note: you'll need to trim in a 3:1 ratio to maintain the 3/4 to 1/4 wave.

It has been noted that this design can lead to rf coupling onto the feedline. To avoid, put ferrite beads on the coax at the feedpoint, or use 3-5 turns of coax (1"-2") taped together at the feedpoint.

You may attach an alligator clip to the plastic on the top of the antenna in order to easily hang it. Alternately, punch a hole near the top and use a length of fishing line to hang.

This design appears on many BBSs, in club newsletters, and in books; the earliest reference that I know of is a Jan. 1984 D.A.R.C. antenna article by James Burks, KA5QYV. This antenna is relatively broad-banded and will be more than adequate if simply built as noted in steps above.

FYI, the 1/4 wave sections for other center frequencies are:
144 MHz =17 inches, 145 =16.88, 146 =16.75, 147 =16.65, 148 =16.54

I usually just go ahead and solder the coax in place and trim down to as close to 1:1 vswr as I can get. I use the MFJ vhf antenna analyzer and a frequency counter then afterwards test with a radio and in-line swr/power meter. When done, the antenna should also present 1:1.2-3 vswr in the center of 444MHz band as well (demonstrated on my dual-band meter and Alinco DJ-580).

3760. Re: Radio Shack Discone any good for ham?

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-14 16:48:57 UTC
From: gary@kimbark.uchicago.edu
Message-ID: <1992Oct14.164857.27217@midway.uchicago.edu>
Source record: 284192

I use it for transmitting on 2m and 440mhz. It shows very low SWR.
It does not have much gain. The ARRL Antenna book claims that the
discone design has the gain of a dipole.... about 3dbi

I've found that the discone is a good general purpose, broad band
antenna that can be used for receiving and transmitting (on certain
bands).

For a scanner antenna, I would recomment the "dipole cluster" available
from Grove and other suppliers.

Gary

3761. FT411E Mods

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-14 16:54:15 UTC
From: abaumhau@udecc.engr.udayton.edu
Message-ID: <Bw4EyJ.LzE@udecc.engr.udayton.edu>
Source record: 284190

Yes, I'm sure this has been asked may times.... I have tried numerous times to contact the mods server in the FAQ to no avail. I already know about the extended receive you get by holding in the A and B keys while powering on the unit. I have heard rumors about a jumper modification and a computer link to the unit. I have tried the computer link at 9600,8,n,1 and either the settings are incorrect, or the data is binary. Problem is, how does one decode this data and change it? Supposedly, modifing the dump and uploading it will add additional TX and RX across the full range of the PLL. If anyone knows of these mods, or others, "I'm all ears" as Ross says.

Also, on this radio, is the PTT line grounded or pulled down through an external resistor. I just purchased a BayPac and am unable to make the unit TX. Any ideas?

|>

Just for the record, Tel-Com is not totally unlamented. I liked the place, I liked the people who worked there. The smell was "distinctive" certainly, but -- hey -- my opinion was that it was a small price to pay for having a ham store 15 minutes from my house.

Jim and Fred were friendly when approached in a friendly fashion. They were brusque when giving advice. They absolutely flayed people who approached them with arrogance. I miss them.

I like HRO, I like Rivendell. I cannot count it a positive thing to have a ham store go out of business.

3765. 6 meter HT would be nice

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-14 17:32:47 UTC
From: whs70@dancer.uucp
Message-ID: <1992Oct14.173247.979@porthos.cc.bellcore.com>
Source record: 284261

Why doesn't one of the major vendors of ham gear have a 6m (or maybe
a 10m/6m) HT available. The low power of an HT would be ideal for ham
to ham communications at flea markets, etc. plus it could make a
nice mobile that could be used with the small (but growing)
number of 6m repeaters.

The low use of 6m is perhap (as I see it) a self fulfilling prophesy.
No/low use of 6m means no commercial equipment (although the new ICOM
IC-729 HF transceiver with 6m intiques me) and no commercial
equipment almost guarantees a low usage.

A good possibility for a mobile would be for Radio Shack to come out
with a 6m version of their 10m CW/SSB mobile unit that sells for
about $200. If they could add FM that would make it a great rig.
Anyone out their in TANDY Land read this newsgroup?

Anyway, just some random thoughts from a 6m wanna be.

3767. Examination Opportunities Scheduled 10/14/92 to 2/01/93

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-14 18:01:31 UTC
From: bjahnke@arrl.org
Message-ID: <634@arrl.org>
Source record: 284160

AMATEUR RADIO EXAMINATION OPPORTUNITIES

The following test session information is provided by the ARRL/VEC for the upcoming six to eight week period. For further information, please contact the test session CONTACT PERSON at the telephone number provided. If necessary, you may contact the ARRL/VEC at 203-666-1541 x282 for additional information. Electronic mail may be forwarded to the ARRL/VEC via USENET at "bjahnke@arrl.org" or via MCI Mail to MCI ID: 215-5052.

Although the test session information presented here does not indicate whether walk-ins are accepted or not, most test sessions do allow walk-ins. We encourage you, however, to always contact the CONTACT PERSON at the telephone number provided so that the VE Team is aware that you be attending the test session.

STILL NEED TO PREPARE FOR YOUR EXAM?

If you would like information on how to become licensed; or how to locate Amateur Radio clubs, instructors, licensing classes and/or Novice examiners in your area; please contact the ARRL Educational Activities Department (EAD) at 203-666-1541 x219. The EAD can also provide information on recommended study materials. Electronic mail may be forwarded to the ARRL EAD via USENET at "rwhite@arrl.org" or via MCI Mail to MCI ID: 215-5052.

EXAM LISTINGS - DEFINITION OF FIELDS

STATE
Test Date,VEC,City,,Contact Phone,Contact Person

3768. No, I won't be starting an auto-canceller

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-14 18:58:43 UTC
From: bruce@pixar.com
Message-ID: <1992Oct14.185843.19021@pixar.com>
Source record: 284212

The vote was strongly against auto-cancelling those two users.

It would have been interesting if I'd gotten a majority vote to cancel them: with a majority vote I probably could have gotten away with it, and it would have changed Usenet policy. We still need some kind of self-regulation system that lies between moderated groups and total anarchy.
Bruce Perens

3769. Re: Should we cancel these users?

This just showed up in rec.radio.amateur.misc.

Is it a forgery? And if not could someone local call from pixar call
up this person and tell him the facts of life.

Perhaps to maintain parity we should start using
POM
for "Pre-Old Man" to represent the male condition that corresponds to YL.
It rolls off the tongue nicely. (Unfortunately "P" could also stand for
"pompous" so maybe we wouldn't be able to limit its application to the
young.)

Jon,
This sounds like a nice service. Would it be possible to
include the "official" dxcc country list in the list of
available files?

Thanks.

>(OPINIONS EXPRESSED DO NOT REFLECT THE VIEWS OF CITICORP OR ITS MANAGEMENT!)

I figured this would happen, as soon as the code-free tech rule was added.
The proposer of this crap must be some frustrated general or technician class licensee that just can't (or won't try) to make the grade to advanced or extra.
I guess in the era of fairness (sorta like clintonomics), i not surprised at this.

This proposer must figure that the extra class guys got their licenses thru cheating or bribes, certainly not by working at it.

If this becomes law, the bell has tolled, the end of Ham radio as we know it.
If you think 75 meters is a mess now, just wait!

The ham bands will be nothing more than glorified CB radio!
You probably won't need a license in 10 years (like CB!)

If this rulemaking proposal passes, they'll be alot of ham equipment going up for sale, and a lot of guys turning their licenses. The only good thing that might happen is that used Ham equipment might be cheaper for the guys who decided to put up with all the silly-ness

As the old saying goes: "If you give'em an inch they'll take a mile!.

J.R. Ordon WV2N

As one of those "no-code tech" wanna-bees--

As I recall my prior foray into Ham Radio, the code was the big boggle.

The technical stuff and the operating rules were most reasonable. I also CLEARLY remember that the reason I gave up on CB (gasp) was the general lawlessness and idiocy on those bands. I agree that 5 wpm or so code should remain in the licence, as well as the technical knowledge, just to keep out many of the "idiots". I don't doubt that I am hearing the <click> of many, many, old Pharts lighting up their flamethrowers. I do note, however, that the new blood in the hobby is what's needed, not this silly stagnation that is going on now.

I have spent the last few months with a cheap Radio Shack DX-390 sorta SWL receiver up on the HF ham bands, and all too often it sounds simply boring. Packet, VHF, and UHF is where the technical challenge is. CW should rightfully remain a permitted operating mode, but I fail to see where 20 WPM necessarily makes me a better person--hell, I cant even type that fast--the technical skill, self-policing, and other features of Ham radio is what attracts me. I'm just not into using morse, unless I can do it with a computer--my head just doesn't work that way.

Regardless of the results of this proposal, I a still working on 5 WPM code, but I seriously doubt that you'll find me on HF much. I am also working with a Scout Troop here in Huntsville--I'll be there right alongside the kids learning code and teaching technical stuff. It won't panic me a bit if they can do faster code than I can.

Let's kill the sill S#$t that runs about in the world, and get to the techie stuff--if the 80m Ol' Pharts want to camp there forever, its fine by me--
I plan to have fun (legally and within the rules) elsewhere.

I do suggest that the technical stuff not be diluted though--If someone is going to work the "advanced" bands, they better know their stuff.

BTW, I am a Computer Science type with a EE degree in my past, with more knowledge of old equipment and tube-type stuff than I admit to in public. I am not going to claim that new is necessarily better, but I will instantly discard something that is old for something better. (Anyone got any model 35 TTY's they need fixed? ;>).

Message-ID: <1992Oct14.211358.26791@noose.ecn.purdue.edu>
Source record: 284208

As of October, 1992, The WV9Y VE team in northcentral Indiana will cease
to operate. Recent disagreement with W5YI has lead to the termination of this
valuable service to the region. Since 1989, this team has aided 100's of hams
in the testing and educational area.
Initial frustration was due to the handicaps related to novice classes
being administered by VE's. (VE's are not allowed to distribute study material)
And now there are problems with communicating with W5YI, growth within the VE
team, and inspiring up-grades. For us, the satisfaction can be obtained
elsewhere. Therefore, Farewell to those we have aided, and thanks to those
who helped and participated. 73 es gud dxing! steve and sonya

For whatever it is worth, I just sent tis@arrl a detailed parts
replacement problem that I'm hvaing with my Kenwood TS-520S. I followed
it up with a receipt confirmation request which was promptly replied to
by the Lab manager, who forwarded it on to the Lab supervisor who sent
me mail immediately to tell me that the technician who would handle it
was slightly behind because of a personal injury. That was the end of
last week. Today I got a reply by mail, including the ARRL unsolicited
action of sending me reference material by surface mail, without me even
asking. The response, although not solving my problem, was courteous,
and under the circumstances, prompt. My single 'test case' leaves me
very pleased with this mechanism of communicating with ARRL, at least on
technical matters.

Thanks ARRL Lab folks; Jon, Ed, and Mike.

I recently purchased to GLB400B frequency synthesizer at a local hamfest in order to get an older Yaesu crystal 2M rig on the air on packet without having to buy lots of crystals. The unit that I have does not include the 5Khz offset option that was available for it. Does anyone have information on that option (circuit diagram, parts, modifications, etc.) that they could send/loan me so that I can update my unit?

Also any information on connecting the GLB to a Yaesu FT224 would also be helpful.

Please e-mail to saltzman@crd.ge.com

Thanks in advance for responses.

3782. QRP Rigs List

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-14 22:10:54 UTC
From: jeffj@cbnewsm.cb.att.com
Message-ID: <1992Oct14.221054.4640@cbnewsm.cb.att.com>
Source record: 284205

I was preparing a list of QRP rigs that were available for
a Intro to QRP class that I am teaching at Pacific Con (Sat at 3:00)
and I thought the net might like this list also. So here it is;

Oak Hills Research
20 and 40 Meters
2 to 3 Watts
$149.95 Kit
616-796-0920

MFJ
15 to 40 Meters
5 Watts
$179 Built
800-647-1800

Tejas
17 to 80 Meters
Watts unknown
$139.00 Kit
Fax 713-840-8608

A&A
20 to 40 Meters
5 Watts
$159.95 Kit
714-952-2114

Ramsey
Receiver $29, 20 to 80 meters, Kit
Transmitter $29, 20 to 80 meters, Kit
1 watt
716-924-4560

CM Howes
40 and 80 meters
Watts Unknown
$164.95
219-594-3661

I know that I am missing Kanga Kits which has the Sudden Receiver but
this is best I could do on short notice! Hope this helps in some way!

73!

Now this seems like a reasonable way to go. After passing 5 written tests
and 3 code tests to get my Extra I couldn't help but wonder now what was
that all about. You could easily distill those 5 tests down into 3 and
not lose anything. A truely erratic series of questions is covered in
those series of tests. Going to be interesting to see how the ARRL and
Wayne Green react to this! I am totally in favor of the above series
licenses and think it is about time. I do feel that the General should
focus on the theory and the basics of constructing your own rig. Now
that would be usefull! 73!

VE7GRI writes:
>I need to make a 0.5 uh coil but I have no idea what kind of wire to use and
>how many turn will be required. Can anyone help?

A useful formula: L=n^2 * r^2 / (9r+10l)

where L is inductance in microhenries, r is the coil radius in inches,
l is the coil length in inches, and n is number of turns.

You didn't mention what frequency you will be using it at or what
unloaded Q it will need at that frequency. If we assume 25MHz
and an unloaded Q of about 300, and a length the same as the
diameter, the diameter should be about .6 inches. (There's a
graph and formula for this in Sams' "Reference Data for Radio
Engineers"; I can post a formula if folk are interested...)

From that and the above formula, n=6.95, darned close to 7 turns.
Choose a wire size such that the turns are spaced by about one
wire diameter, to keep inter-turn capacitance under control:
wire diameter = 0.6"/13 = .0462", which is real close to 17 gauge
(which is hard to find unless you visit motor rewind shops); use
18 or 16 if it's handy. Even 14 should be fine. Bare or enameled,
or even plastic insulated if you want. Solid copper holds its
shape well without a former in this sort of size (but how stable
does your application require?).

3795. ARRL Computer Networking Conference UPDATE 14 OCT 92

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-15 01:44:17 UTC
From: n2dsy@cbnewsh.cb.att.com
Message-ID: <1992Oct15.014417.7822@cbnewsh.cb.att.com>
Source record: 284224
Cross-posted to: rec.radio.amateur.packet,rec.radio.amateur.misc

PLEASE POST EVERYWHERE !!!!!!! Reposted with corrected directions
& additional details.

The Radio Amateur Telecommunications Society (RATS) is proud to host the

11th ARRL Amateur Radio Computer Networking Conference

to be held on Saturday, the 7th of November 1992

at Fairleigh Dickinson University, Teaneck, New Jersey.

The conference will feature both advanced and beginner's talks by
many of the leading contributors to the Amateur Radio digital community.

The Conference schedule of events for November 7th includes the main
Conference presentations, beginner's sessions and demonstrations
starting at 8:30 AM and continuing until 5 PM. A hero lunch will be
provided by CQ Magazine. Admission to the Conference is $30.00 and
includes admission to these other interesting events:

Friday, 6 November

The ARRL Education Department is sponsoring a Digital Signal Processing
(DSP) Course from 9 AM until 5 PM at the Conference hotel (see below).
This exciting course will be given by Jon Bloom, KE3Z ARRL Senior
Engineer. Contact Rosalie White at the ARRL Education Department
(+1.203.666.1541) for details.

Conference registration begins at 5 PM at the Best Western Oritani
Motor Inn, Hackensack, New Jersey. The hotel is across New Jersey
Route 4 from the University. Call in advance for reservations at the
Conference rate of $55.00 per night. The hotel telephone number is
+1.201.488.8900.

Friday evening will feature "Birds of a Feather" (BOF) sessions and
demonstrations. To be sure there will be BOFs for the HF Forwarding,
TCP/IP, ROSE, and TheNet folks, as well as for other communities of
interest. Contact Gordon Beattie, N2DSY (+1.201.387.8896) if you
would like to organize a BOF or need information. There will free
refreshments and munchies for those attending the conference.

Saturday, 7 November

While the Conference activity proceeds at Fairleigh Dickinson
University, your spouse, children and/or companion might wish to
enjoy the shopping available at some the many shopping malls that
have made Paramus, New Jersey famous as a "shopping mecca". The

Riverside Square Mall is next door to the hotel (a few hundred feet)
and most of the rest are within a mile or two of the hotel and
University and are easily reached by car, bus or taxi.

After a day of Conference activity we will all return to the hotel
for a pizza party. Note: This is now a sponsored event and will be
FREE for conference attendees.

During the evening, several commercial Amateur Radio manufacturers
including Pac-Comm Packet Radio Systems, Kantronics, HAL Communications,
and others will present their products and answer questions.

A special feature of the evening is that many of these manufacturers'
products will be available for sale. KJI Electronics (+1.201.239.4389)
and Pac-Comm (+1.813.874.2980) will have digital controllers, radios,
antennas and accessories available for sale during the evening.
If you wish to purchase an item of particular interest, call them in
advance of the event to make arrangements for pickup at the Conference.
Other manufacturers of Amateur digital controllers will be announced as
confirmations arrive.

The evening will continue with more BOFs until we all decide to get
some sleep!

Sunday, 8 November

The schedule is open to allow those who need to complete conversations
begun earlier to come to a fruitful conclusion. The Coach House Diner
is located across New Jersey Route 4 from the hotel and is open 24 hours
a day. Many of us will be there around 8 AM for breakfast.

Air Directions

The Conference can be reached by commercial air to any of the following
airports: Newark (NJ), LaGuardia (NY), Westchester County (NY) or
Kennedy (NY). Newark and LaGuardia are within a $45 cab ride from
the conference. Kennedy is a bit more. Definitely rent a car with a
reservation if you plan on going to Westchester. (Note: It has been
noted by some callers that Westchester is quite a savings on
airfare.)
General aviation aircraft can fly into Teterboro Airport or one of
the other local fields.

Ground Directions

From the East and Northeast:
Take Interstate 95 south to the George Washington Bridge. Continue onto
NJ Route 4 West to Hackensack Ave. Go north one half block on right.

From the North:
Take the Garden State Parkway south to NJ Route 17 South to NJ Route 4 East.
Take the second Hackensack Ave. exit. Go north one half block on right.

From the South:
Take the Garden State Parkway north to exit 161 onto NJ Route 4 East.
Take the second Hackensack Ave. exit. Go north one half block on right.

From the West:
Take Interstate 80 East to the Garden State Parkway north to exit 161
onto NJ Route 4 East. Take the second Hackensack Ave. exit. Go
north one half block on right.

The hotel address is: Best Western Oritani
414 Hackensack Ave.
Hackensack, NJ 07601
Tel: +1.201.488.8900

For hotel reservations please contact the hotel.

For Conference information call: Gordon Beattie, N2DSY
+1.201.387.8896 (Eve)
+1.908.957.6345 (Day)

73 & See you there!

Does anyone have modifications to the Alinco DJ-F1T to increase the TX range to include MARS/CAP frequencies? I had the RX increased at time of purchase, but not the TX. Please e-mail any help. Thank you.

Bruce,

Come on get real. We all have a kill file or at the very least the "N" key works very well. I don't need someone playing censor for me. Boy, It is beginning to smell like Washington D.C. around here!!

I agree - the real fun is in the unexplored territory... What about leaving the most advanced license at around 12-13wpm. This is not an insurmountable challenge.. takes about 3 weeks of active preparation... In Canada, our 5wpm license gives 160m and 80m. Only with knowing 12wpm do you get the rest (including 10)... No codes, of course, get vhf and up...

>
>Let's kill the sill S#$t that runs about in the world, and get to the techie
>stuff--if the 80m Ol' Pharts want to camp there forever, its fine by me--
>I plan to have fun (legally and within the rules) elsewhere.
>

I have a story to tell about the 80 folk... I was trying to check into a 80m net here in the maritimes -- well, I had a faulty audio cable that was giving out rasping sounds... Anyways, needless to say I couldn't check in. But later I went down to the lower end of the band to see if I couldfind out the problem and I passed by a couple of people talking about the net saying this like "that *&^*&% doesn't even know how to use his radio.. what a stupid ... ad nauseum... " Talk about a mess... And all of these people talking were up there in years... I don't care what anyone says, just because I got my first license as a no-code, I feel my operating practices and desire to learn more (I am the pres. of the unb amateur radio club -- a very active bunch on everything from vhf/hf packet, cw, rtty, vhf, basically whatever we can get our hands on...) make me a 'better ham' than many people I hear fouling up the airwaves...

Maybe we should get with the times... instead of having to demonstrate the gymnastics of learning something trivial like code (I have my full license.. I am not a 'soon-to-be'.), why not demonstrate *ability* in electronics. Shouldn't we be able to focus testing on design than on code...

On a lighter note, I am pretty amused by all of the "learn code in an after-noon...", "Learn code by hypnosis", etc tapes...

hmmmmm

I have the program Yagimax but it seems inappropriate for my design...

Is there a program which will calculate dimentsion of a yagi given
items like # of elements desired, centre frequency, bandwidth, etc...

It can be for any architecture.. unix, amiga, mac or ibm...

Derek

3800. For those interested in W2A modification

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-15 06:03:05 UTC
From: jmeyers@ecst.csuchico.edu
Message-ID: <1bj1ipINNa10@charnel.ecst.csuchico.edu>
Source record: 284230

I just modified a friend's Icom W2A this afternoon and came across something to look for if you do the same.

I had pulled the single diode, and installed the two new ones ordered from Icom. Mod didn't work. I checked all solder connections, re-assembeled and mod didn't work. I found that I had left a solder bridge when removing the factory diode - fixed that, mod didn't work. I reset the CPU, mod didn't work. Finally, I noticed that 5 of the 6 diodes ordered from Icom (extras for friends) were labeled MP. One that I had installed was labeled MB. Pulled that sucker out and threw in one of the MP guys and mod WORKED!

I'm not 100% sure that the problem was the wrong diode. But it sure seems that way. Moral of the story - check your parts before you start.

3801. kerchunking repeaters

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-15 07:18:37 UTC
From: wejones@crdec7.apgea.army.mil
Message-ID: <9210151714.aa02817@crdec7.apgea.army.mil>
Source record: 284129

Nothing seems to annoy old timers more than hearing the frequent
kerchunking of people keying up to see if the repeater is working, and I
don't know how many times I have heard it stated that this is illegal, such
as in one of the novice exam questions. In fact about 2-3 weeks ago
someone made the statement in this forum to the effect that such
unidentified transmissions are illegal.
Well I get annoyed as the next guy at listening to all the
kerchunking, but is it really illegal? Part 97 specifically
states that "Test" emissions, ie " Emissions containing no information...."
are permitted on 2-meter and above, provided that they are "for brief
periods for experimental purposes", and these are by definition not
identified. The passages where Part 97 requires identification all
refer to "communications or signals", both of which infer emissions
containing information. The way I read the regulations, kerchunking
should be perfectly proper, yet I have yet to meet a ham who thought so.
Any comments?
B.J. N3JLQ

3802. BAT31 noise diode or eq. wanted

The following is a list of informational files for this newsgroup
available via anonymous FTP from ftp.cs.buffalo.edu (currently at IP
number 128.205.32.9).

Questions to bowen@cs.buffalo.edu

1750m.band - misc info on the 1750m band
ampr_coordinators - coordinators for packet IP addresses
antenna_refs - references for articles about antenna designs
arrl-logo.ps - ARRL logo in PostScript format
arrl_bib - bibliographies from ARRL literature (ASCII format)
arrl_digital_minutes - Minutes of the ARRL committee on digital comm.
arrl_fo_jobs - descriptions of some ARRL Field Organization jobs
arrl_info_service - announcement of the ARRLs trial information service
cal_pd_freq - California police frequencies
callbook.tar.Z - sources for the marvin callsign server v1.3
canadian.Z - Canadian ham database in FCC format
carpet.loop.2 - Antenna for apartments and small spaces
comb6.zip - HF Propagation Predication program
docket_91-36 - information regarding the proposed scanner regs
element_credit - rules about VE credit for earliers exams
elmers_admin - information about the elmers list (see below)
elmers_list - list of elmers on the network
exam_ops - info on exams and exam opportunities
faq_ham_1 - frequently asked questions about ham radio (pts 1)
faq_ham_2 - frequently asked questions about ham radio (pts 2)
faq_ham_3 - frequently asked questions about ham radio (pts 3)
faq_ham_4 - frequently asked questions about ham radio (pts 4)
faq_ham_5 - frequently asked questions about ham radio (pts 5)
faq_ham_6 - frequently asked questions about ham radio (pts 6)
faq_packet - frequently asked questions about packet radio
fft.com - EGA/VGA DOS command for spectral display (QST 1/92)
ffth.com - Hercules DOS command for spectral display (QST 1/92)
field_day_92 - field day rules for 1992
florida_antenna - Florida State antenna law info
guide2newsgroups - description of USENET newsgroups dedicated to radio
ham_sat_sum - summary of information needed to get on satellite
hams_on_usenet - list of ham operators and e-mail addresses on the net
hamstacks - information about the question pool stacks
handicap_waiver - info on obtaining a handicapped test waiver
hf_rigs - QST reviews of available HF rigs
```

ht_info - general information about commercial hand helds
intro_to_swl - info for aspiring short wave listeners
intro_to_scanners - info for aspiring scanner listeners
lead_acid_batteries - essay on lead-acid batteries
license_plates - guide to ham calls on license plates
logos - PostScript logos for various ham organizations
mail_order - a database of electronic mail order shops
manufacturers - names and addresses of ham gear manufacturers
new_packeteers - helpful essays for new packeteers
newcomers - tips and hints for those new to amateur radio
packet_clubs - organizations you can get more packet info from
packet_gateways - list of gateways from packet to Internet
packet_misc - miscellaneous packet info
packet_software - list of packet software versions
phone_bbs_list - phone BBSs for ham related issues/software
pio_handbook - ARRL Public Information Officer's Handbook
pr_docket_92-136 - text of FCC PR Docket 92-136
qsl_bureau1 - information about the ARRL QSL bureau
qsl_bureau2 - "what should I do if" list for the QSL bureau
qst_prodrev - index of ARRL product reviews in QST
repeater_map_proj - description of Electronic Repeater Mapping Project
rfi_tips - good posting about RFI
sol_geo_data - desciption of daily solar geophysical broadcasts
sol_terra_terms - glossary of solar-terrestrial terms
sstv_wefax_info - general help for SSTV and WEFAX users
usenet_purchases - tips on buying and selling via USENET

For readers of this newsgroup both new and experienced, these files are
a de-facto "Required Reading List" to provide definitive answers and
pointers to other sources for questions that come up in this forum.

This is also your archive, so any additional articles, guides, or small
PostScript graphics that you feel would enhance this collection are most
welcome. Submit to Devon via his E-mail address above.

Additional archives out there that have /pub/ham-radio directories are
encouraged to "mirror" these files to provide redundant storage for these
documents. Some of these sites (which may or may not mirror

3804. ARRL info server

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-15 11:11:24 UTC
From: sbaker@umassmed.UMMED.EDU
Message-ID: <9210151110.AA00819@umassmed.UMMED.EDU>
Source record: 284243

I would like to congratulate the league for
1 joining the internet
2 allowing it's employees to respond to postings on this list
3 establishing the information server/archives.
Good job! The league in doing the above has made itself more responsive
to the membership and is providing a real service. I feel it is more
than a monolithic entity with one-way communications that only arrive
once a month in the mailbox (Q street).

I would ENCOURAGE the league to:
1 establish an anonymous FTP server for ham related software
2 have full text copies of back issues of Qst with GIF files
or the like for graphics
3 provide a bibliographic index for ham magazines, or at
least QST
4 put their BBS up on the internet for TELNET sessions rather
than just dialup's (contrary to myth this CAN be done, call
or e-mail for info).
5 CHANGE THE CONSTITUTION OF THE LEAGUE to allow voting by the
membership on officers and policy by MAIL rather than at
meetings or board.

Again, congratulations!

> 28 Wed 11:09:12.000 00 36 Wed 12:00:00.000 0 32.0

SVs 3,11,12,13 are Block I or prototype satellites on which SA is not imposed.
All Block II or "operational" satellites are supposed to have SA on.
Multiplying the URA by the dilution of precision or DOP (representing the
geometrical relationship of the receiver and the satellites) gives an idication
of position accuracy. With a typical DOP value of 3, we would get a position
accuracy of 96 metres for those satellites that have a URA of 32 -- close to
the stated 100 metre (2 drms) accuracy of the GPS Standard Positioning Service.

It certainly would have started a war, with *your* messages being
cancelled as fast as your system could generate them.

Thanks for nothing. It wasn't too long ago that there was no incentive to get an Extra Class license. Guess what? Hardly any issued. Now this proposer wishes to reinstitute it.

All this has been argued ever since FCC brought in incentive licensing. Always the guys at the low end whining about why they can't get the higher privileges, without paying the entry requirements. I'll warrant that the majority of 4 letter calls will favor this and the majority of 2 letter calls will be against it. It all depends upon who has an axe to grind or whose ox is being gored.

OK, I agree that the CW requirement is becoming increasingly anachronistic. But how would you like this? Keep the present classes and incentives but make the techical requirements increasingly higher. Except for a very few, I'd bet that wouldn't change very many existing classifications, even if nobody was grandfathered into place.

> The petitioner has asked for a limit to inputs from the ARRL on the grounds
>that the League has a vested interest in keeping incentive-licensing, since
>it is more lucrative to sell manuals/training aids for 5 classes of license
>than it would be to sell them for only 3 classes. Interesting point.

What baloney! If the ARRL didn't supply this demand, someone else would.

Face it, guys, the FCC will give this one short shrift.

Forrest Gehrke feg@dodger.att.com k2bt

BTW, I didn't get an Extra Class until the FCC put in the incentives to get one, even though I could copy code

at 35 WPM.

3810. UHF Televsion Antennas useful for anything?

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-15 12:50:43 UTC
From: johnr@mik.uky.edu
Message-ID: <1992Oct15.125043.19070@ms.uky.edu>
Source record: 284236

I am just getting started and am very quickly appreciating the tower that was installed 20 years ago for televsion use. However now I would like to put up a 144/440Mhz vertical antenna and was wondering if I should take down the old UHF yagi that is up there now and put the vertical on top of the tower, or if I should leave the yagi up there and attach the vertical to the side of the tower.

If the yagi could ever be used for anything then I guess I will leave it up there. I guess my question is what uses do UHF television yagis have?

Thanks for all your help!

Well, I have discovered that suggesting people learn to tolerate each other, at least when the subject at hand is smoking, is most definitely NOT "popularly correct" :-) Given the "oat bran" and "Jane Fonda workout tape" tone of modern society, this is to be expected, I suppose.

What was interesting is the reaction level of some people out there - as someone who has been on Usenet for about 10 years now, I have to say the flames do run considerably hotter (and bizarre) in 1992!

Message-ID: <1992Oct15.130349.1610@wam.umd.edu>
Source record: 284238

Just like real life, are the ham bands. Being able to do 5 WPM gives HF privileges. 10 meters can be a lot of fun, as can 15, 40, and 80 meter CW. BUT the point behind incentive licensing is that if you want more, you have to work for it. No, I can't say that a higher-class license makes one ham better than another, because it's not true.

What I CAN say is that if I want to work on the little section of the 20 meter phone band allocated to Extras only, because they're not very heavily used, and I want to work some DX in the clear, I will WORK to get that privilege. That's just the point - it's a PRIVILEGE, not a right.

If you are happy with your privileges granted by your license, great! If you find that you would like to build and launch your own satellite, you should have to work for that privilege.

Incentive licensing, especially the code part, show how much dedication and desire one has to upgrade and receive a greater set of privileges. The no-code license has been a great thing for Ham Radio. But anyone can memorize the answers to written tests, given enough time and a standard question pool. It doesn't take a law degree to be a good litigator or prosecutor. It doesn't take an engineering degree to be able to design stuff. It just means that you have put in the time and effort to earn a certain status, for which one can command respect. That's why incentive licensing exists. If you want more, you have to work more.

3815. W5YI report..

> I figured this would happen, as soon as the code-free tech rule was added.
> The proposer of this crap must be some frustrated general or technician class
> licensee that just can't (or won't try) to make the grade to advanced or extra
proposer is WA8HSU, William Wells - extra class...files are in the Hamnet
libraries on Compu$erve. I need to do a check for new files on GEnie to see
if it's moved over there. Look for a file called "RMXXXX.TXT" or similar.
(it's RMXXXX because there's no RM number assigned at the time of upload)
i've got it at home....it's basically a return to the pre-incentive licensing
scheme. not too long.

i don't think it's going to go through (miracles do occur). it doesn't have
that "feel" that the code-free tech license proposals had. if we were going
to overhaul the license structure the time to do that would have been back in
the early 80's about the time the VE program came in or during the code-free
tech discussion.

it's pretty obvious that the ARRL would be resistant to such a change.

> I guess in the era of fairness (sorta like clintonomics), i not surprised at
> this.
>

this isn't his first proposal. his similar ones in the past have been dropped
unceremoniously also. I suspect some sort of hidden agenda in there
somewhere. Wells is too vocal about not receiving benefit from the
change...whereas i see DXer extras and advanceds instantly going "Now wait
just a cotton pickin' minute..."

> This proposer must figure that the extra class guys got their licenses thru
> cheating or bribes, certainly not by working at it.
>

the more cynical of us probably are thinking that WA8HSU is a shill for
compu$serve - generating controversy so you'll spend $/hr reading and ranting.
hamnet tends to get slow when you don't have a couple of controversial
subjects going or WA4D isn't around.....even the political battles between
W6TNS & others over Perot, Bush and Clinton only ran hot for a short time...

3816. Kenwood TS-520 help needed

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-15 13:06:47 UTC
From: saltzman@ISOVAX
Message-ID: <1992Oct15.130647.886@crd.ge.com>
Source record: 284240

I have a Kenwood TS-520 and TS-520S HF transceiver, both in excellent condition. As I compared the performance of the receivers against each other last week I observed some significant differences that caused me to look into tuned circuit alignment. As expected, the poorer performer was quite out of alignment. I have the operator and service manuals, and following the recommended procedures was able to significantly improve the alignment of the weaker system (TS-520S) on all bands - until I got to the 28Mhz band.

As I attempted to very carefully turn the ferrite tuning slugs in the 28Mhz variable inductors, I found them immovable and the hexagonal keys behaving like they were 'stripped' (As a former TV/electronics repairperson, I was using a professional tuning tool - I do not have the ones that were originally shipped with the transceiver). Other than some initial movement, about a 1/4 turn, I am unable to turn these slugs in either direction. It appears that the slugs, of soft composition, are in fact damaged.

Interestingly this problem only exhibits itself with the 28Mhz coils, antenna, oscillator, mixer and driver - all of the coils in the other bands could be easily manipulated and appear to be made of harder ferrite composition. I noticed that the tops of each of the 28Mhz slugs appear to have a pink-red color code painted on them, leading me more to believe that they are of different ferrite composition than the others. None of the other slugs have any color coding.

The problem of course is what to do to replace these slugs and/or coils in order to align this transceiver band. I called the Kenwood east coast parts distributor and as expected they told me that the parts (I have part numbers from the service manual) are no longer available. They recommended that I call the factory. I talked to Kenwood customer service, and they told me the same thing. I insisted that they bring this matter to the attention of the engineering department which they agreed to do. My contention was that the TS-520 is still a widely used transceiver and parts replacement and/or substitution is an important issue for the owners of this almost 20 year old unit.

I got a call back from Kenwood with a discouraging response. The engineers agreed with my concerns and in fact have been trying for quite some time to get coil replacement information from Kenwood Japan, but unsuccessfully. They had no other information to give me and in effect said, sorry, you're out of luck - clearly and unsatisfactory response.

There is no doubt in my mind that other TS-520 owners have encountered this type of problem (with these specific coils, or with other parts) and maybe they have shared their problem with other Network News or

Kenwood users group users.

Does anyone have any recommendations or specific information on how I might repair or replace these defective coil/coil-slugs in my transceiver? I have a junk box full of all sorts of slug-tuned coils, some of which may physically fit in the TS-520 forms, but I would not assume that ferrite characteristics are irrelevant. I also do not want to destroy the existing slugs until I have a course of action with a predictable outcome (I am not certain how far out of alignment the 28Mhz tuned circuits are).

I have communicated with ARRL Lab on this matter via email. They have suggested trying to connect with a Kenwood users group for help. Anyone aware of such a group? They also referred me to replacement coil manufacturer Toko, a good idea if I had the electrical specs of the coils. Another suggestion was to acquire a 'scrap' TS-520 for parts, but that seems to be an unlikely opportunity. I have never seen a junker. I bought both my rigs in excellent condition for the going price, and plan to sell the TS-520 as soon as I get the TS-520S problem resolved. I can't see scavenging a perfectly good rig for parts yet.

Any help that anyone can give me with this, or other TS-520 problems, would be greatly appreciated. I have been told that this matter has been discussed in Network News before, but as it is new to me, and I a relatively new net news user, I was not aware of it.

Thanks in advance for any help.

Message-ID: <8256@vtserf.cc.vt.edu>
Source record: 284239

I have an AMTOR problem with my DSP-2232. When I connect to some PK-232s that have 1991 firmware in them, the link goes to all errors when the first changeover occurs. Either one of us can call the other and the link works fine until the changeover. One station I have problems with is U5WF on 14.075. I can talk to this one just fine with 1990 firmware in his PK-232, but not 1991. I would really like to hear what happens when someone else with a DSP-2232 tries to connect to him. The selcal is UUWF and the MBO is on most of the time. I connect and idle with no errors. When the MBO forces the changeover, the link goes to all errors. You can leave a message there for me (KC4ZEN) or Victor (UB5WE) or just send e-mail to me if you have any results to report.

Rich.....

In <1992Oct14.210518.24730@lambda.msfc.nasa.gov>
rich@theophilus.msfc.nasa.gov (Rich Krum) writes:

% As one of those "no-code tech" wanna-bees--
%
% As I recall my prior foray into Ham Radio, the code was the big boggle.
%
% The technical stuff and the operating rules were most reasonable. I also
% CLEARLY remember that the reason I gave up on CB (gasp) was the general
% lawlessness and idiocy on those bands. I agree that 5 wpm or so code should
% remain in the licence, as well as the technical knowledge, just to keep
% out many of the "idiots". I don't doubt that I am hearing the <click>
% of many, many, old Pharts lighting up their flamethrowers. I do note,
% however, that the new blood in the hobby is what's needed, not this silly
% stagnation that is going on now.

Well, being 20 years of age as well as a YL, I cannot see myself
fitting the above description...;-) (Except the part about "New blood"....I
am that.....I've only had my license about 2 years.....)

I'm afraid I must disagree with most of your comments.....CW is (in my
opinion...) *the* most reliable means of communication on the HF bands.....
Deleting the higher code requirements would undoubtedly bring on a new breed
of amateurs that would have absolutely No idea of what to do when the ssb just
doesn't cut it or when the phone bands are more crowded than the cw
ones....(This is pretty common as far as I have seen.....)
Surely with the new multiple choice cw exams that some VE Teams are
using, you'd be able to pass 20WPM, don't you think? It's not *that*
hard....Even *I* did it......(Pending new license and callsign....maybe 2 or
three weeks now! Yippee!)
I agree with the other gentleman.....that proposal was probably made
by someone that either can't (Or more likely *won't*...) learn the code....
It shouldn't be as easy as passing a few muliple guess tests (without
13 or 20WPM) to get *all* HF privileges....I mean c'mon....If all of us that
are Extras now could do it, so can [most...barring a physical impairment]
Anyone else.....

%
% I have spent the last few months with a cheap Radio Shack DX-390 sorta
% SWL receiver up on the HF ham bands, and all too often it sounds simply
% boring. Packet, VHF, and UHF is where the technical challenge is. CW should
% rightfully remain a permitted operating mode, but I fail to see where 20 WPM
% necessarily makes me a better person--hell, I cant even type that fast--the
% technical skill, self-policing, and other features of Ham radio is what attracts

% me. I'm just not into using morse, unless I can do it with a computer--my
% head just doesn't work that way.

OH NO! Not more HAM POLICE!!! (October Issue of QST....read it. It's
pretty funny.....)

%
% Regardless of the results of this proposal, I a still working on 5 WPM code,

Good for you! :-)

% but I seriously doubt that you'll find me on HF much. I am also working with
% a Scout Troop here in Huntsville--I'll be there right alongside the kids
% learning code and teaching technical stuff. It won't panic me a bit if they
% can do faster code than I can.
%
% Let's kill the sill S#$t that runs about in the world, and get to the techie
% stuff--if the 80m Ol' Pharts want to camp there forever, its fine by me--
% I plan to have fun (legally and within the rules) elsewhere.

Agreed! Personally, I find 80 meters literally nausiating....All the
stupid Idiot mess they talk about......I.E. "What's wrong with this country
[USA] is that we don't have a president (...congress, etc....) that gives a
____ (Fill in the blank...) about our country!!!..." I think I'd be happier
if my radio didn't even *have* the ability to do anything on 80m!!!

%
% I do suggest that the technical stuff not be diluted though--If someone is going to
% work the "advanced" bands, they better know their stuff.
%
% BTW, I am a Computer Science type with a EE degree in my past, with more
% knowledge of old equipment and tube-type stuff than I admit to in public. I
% am not going to claim that new is necessarily better, but I will instantly discard
% something that is old for something better. (Anyone got any model 35 TTY's
% they need fixed? ;>).

In article <1992Oct14.195445.5829@ttinews.tti.com> sorgatz@avatar.tti.com (sorgatz) writes:

..sez that there is a move afoot to petition the FCC for a change in Amateur license structure such that:

There would be only Novice, No-code Tech, and General! The request has not yet been given a docket number, but it seeks to eliminate the 13 & 20 WPM CW requirements, giving current General and Advanced license holders the same privileges as Extras! Current Tech Plus (old Elem 3 Tech) would be grandfathered to General, and persons seeking a distinctive skills test could take the 13 or 20 WPM CW exams and earn an endorsement of 'CW Expert' or 'CW Master' which would NOT give them any additional frequency space.

<... okay, you remember the original post... I won't repeat all of it...>

My two cents worth:

I'm an Extra class operator and I got it the old fashioned way. I studied the subject matter and learned the laws/formulas/principles/code. I enjoyed the experience, looking at it as a challenge. After doing the work to learn CW up to the 20wpm mark, I've found that I prefer it over phone and use it almost exclusively when I'm on HF. The technical information I had to learn has stimulated me to learn even more. However... now that it's behind me I have reflected on the whole exercise and come to an opinion or two.

CW is irrelevant. It's one mode among many. Sadly, no other mode is stressed. I would much rather see a lot greater emphasis put upon digital communications techniques and much less emphasis put upon CW.

The depth of technical knowledge required to pass the tests is quite shallow. I understand the reasoning for the multiple choice exams with the published answer set (I'm also a VE). I wish there was a better method of assuring that the applicants actually UNDERSTOOD the subject matter and could apply that knowledge.

I think that we could get by with ONE license and a series of endorsements. (HF endorsement would require 5wpm cw skills for ITU compliance, digital auto-forwarding endorsement would require proof of technical knowledge of various networking philosophies, repeater endorsement would require demonstrated knowledge of the applicable laws etc.) With this kind of a pick-and-choose structure, people would not be required to study things that they are not interested in knowing or are not prepared to exploit. It could, by virtue of it's narrowness, be a much more exhaustive test of one's abilities (in that one specific area) than is currently possible. It would reduce some people's prejudicial view of "lower class" licensees by making the comparisons comparisons of apples and oranges. (If one has

HF and ATV endorsements is he better or worse than one that has digital
and microwave endorsements?)

I would like the VE teams, under the authority of the VEC to be able to
issue a 60 day temporary license that would enable the successful applicant
to get on the air immediately.

There's more... perhaps I'll post more later... Give it some thought eh?

Re: Smoking

My wife is so allergic to cigarette smoke that if I go into a store (or any other location) where people are smoking, when I go home I have to change AND WASH my clothes and take a shower to get the smoke out of my hair.

Not many places are worth that kind of trouble. Ham stores included.

FYI,
Ron

Could someone please post or email the statistics for the number of licenses issued in each class for the past years? I am most interested in current data. (i.e. last years totals and this years total as of last month)

Surely someone knows this info from the FCC.

Thanks for your help.

^^^^^^^^^^^^^^^

Exactly, and that means *self*; we each decide *for ourselves*
what is right and wrong, and then take personal responsibility
for our own actions within the framework of rules which apply
to everyone uniformly. "Self regulation" does *not* mean YOU
deciding what an individual may or may not say on the net. Taking
the action you proposed in your original post would
have been wrong whether or not a "majority" of those who responded
agreed with you; you don't have the right to censor others,
regardless. The bands are already full of self-appointed guardians
of the public good who in their sole personal judgement decide what
they will allow, and then impose their will on others by force through
QRM. Let's not bring this tyranny to the net as well.

Hello netters,
I'll probably get flamed for this but here goes...

I am looking for old american or british motorcycles that need restoring, the typical farmers barn story, junkyard relics, any old bike that has not been fixed up already.

Why am I asking here?
Well, word of mouth is the best way to find these bikes and I have asked my friends & family to keep a lookout for me. I figured a computer and radio network might be another way to locate old bikes.

I am kindly asking;
a) Does anyone know of any?
b) Would someone take time to ask around radio land?

Thank you for reading this and for any information about bikes you may hear or know about.

eric, open up the radio as if you were going to install the tone squelch unit(its in you owners manual). there will be a red wire and a blue wire in the lower right corner. A magazine said to extend rx one should cut the red wire. If yours is already cut then I guess it worked. The magazine went on to say that by cutting the blue wire in the same fasion as the red one would then open up the tx as well. Good luck...Jason.

As I mentioned in a earlier message that after I had
passed all the tests to get my Extra I came to conclusion that they were
a total mismash. There's little real expansion of knowledge as you go
higher in classes. The Tech and the General are just a rehash of the Novice
test. The only 3 tests that seem to have any value are the Novice, Advanced
and the Extra. At least you learn something off those. If we would reduce
our tests to those 3 and revamp them a bit we would have gone a long way
to improving the body of knowledge out there . I believe that was point
of incentive licensing and after taking all 5 tests it's pretty obvious
that they failed in doing this. Dedication and desire are nice but they have
little to do with ham radio. Save that for public service. This is only
a hobby. 73!

I also have this antenna built into the attic of my home, with RG-58 running to a wall plate. I use the antenna for a scanner and for my Icom 2SAT.

I have never tested the SWR on the antenna, but all I can say is it sure works better than a rubber duck for transmitting on 2 meters in the house.

Good Luck,
Todd N0NUM

Oh goody! Just when you thought it was safe to go back in the r.r.a.m, someone fires up the nocode debate again. Hmm, maybe someone with an archive can dump the entire text of the last nocode flamefest in here to get us started.

C'mon people, either you want the code and you are not going to change your mind, or you don't want the code and aren't going to change your mind, or you've heard it all before and don't want to hear it again! No-one is going to come up with a single new factoid, proposal, point of view, or comment, can't we just leave it along and save the bandwith?

Sigh,

Willie Smith
[Nocode tech with all the bandwidth he needs, thanks]

Hello,
I've heard a lot of Kenwood service bashing here
(and probably well-justified), and at the same
time people seem to praise ICOM service and
response time. So I naturally expected
(according to the postings here),
that shipping will take most of
the time and ICOM will do the
job in couple of days...

Well, here's my story:

The rig's IC-2SRA. Mechanical problem - main dial
broke off (during field operation).

Sent to ICOM by UPS September 24. Rig arrived to
there October 1st.

So far several calls to ICOM got only: "Sorry,
we didn't have a chance to look at it yet, but
real soon now."

Well, as you can see, it has been two full weeks
for ICOM to just hold the radio, and there's no
way to know when they actually start LOOKING
into it, to say nothing about FIXING.

Maybe Kenwood is worse, but this still isn't
very good, I think. Comments?

The formula that's been in the ARRL handbook for many years works pretty
well if you don't need high precision:

L (uH) = [R^2 N^2] / [9 R + 10 L]

Where L is inductance in uH, R is coil radius in inches, L is length
in inches and N is thenumber of turns.

For example, N = 7.5 turns, R = .25", L = .5" gives .485 uH.

I quite recently used a $17 R**** S**** U-70 (or something like that) UHF TV antenna for receiving in our 450/455 MHz broadcast remote-pickup system. It shows about 10 dBd gain, comparable to our expensive Scala yagis and MUCH lighter. I expect you could use it for working the 440 and 900 bands.

>self-regulation system that lies between moderated groups and total
>anarchy.
> Bruce Perens
>

No, we don't. There are very few places where total anarchy can function
without causing the small and the weak a grave disadvantge. Usenet is one
of them. Everyone here is equal. Unlike when on the air, people here
can say anything without worring about a net.police looking over their
shoulder.

I know that being freed from restraint causes anxeity. I know that it is
frightening to rely only on oneself as the arbiter of "Right", but the
lack of higher authority is what empowers us to do so much with this
medium. And make no mistake, there is no higher authority than the
individual poster.

The likelyhood that I'll ever agree with John is vanishingly small, but
he is entitled to his say here, as are we all.

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
October 16 to October 25, 1992

Report Released by Solar Terrestrial Dispatch
P.O. Box 357, Stirling, Alberta, Canada
T0K 2E0
Accessible BBS System: (403) 756-3008

LONG-RANGE HF PROPAGATION FORECAST FOR THE "CQ WORLDWIDE" CONTEST PERIOD

Global HF propagation conditions for the CQ Worldwide Contest period of 24 and 25 October are expected to be near-normal. There is some concern that a recurrent coronal hole will influence propagation during the contest period. At the present time, the leading edge of this recurrent disturbance is expected to begin enhancing levels of geomagnetic activity on 25 October. The brunt of the disturbance is expected on 26 October. However, there is a chance the disturbance could arrive up to one day early, which could influence propagation for the latter half of the contest period (on 25 October).

There is a moderate to high degree of certainty regarding the arrival of this disturbance in the 24 to 28 October time frame with preference for the 25 to 27 October period. Recurrent analysis indicates that this disturbance has been consistently geoeffective for the last two solar rotations. It is a fairly stable coronal structure.

If the disturbance arrives early, expect propagation to be near-normal over all regions on 24 October with high and polar latitude paths slightly less stable than normal. Under this scenario, conditions on 25 October could become significantly degraded over the high and polar latitude paths, with poor propagation into the northern or central middle latitude paths during the night sectors. Low latitude paths would remain near-normal, but would see increased night and morning sector signal instabilities.

At the present time, propagation during the 24 to 25 October period is expected to be good over the low and middle latitude paths, and good to fair over the high and polar latitude paths. The brunt of the disturbance is expected to arrive after the contest period ends.

Consult next weeks weekly forecast for more accurate information.

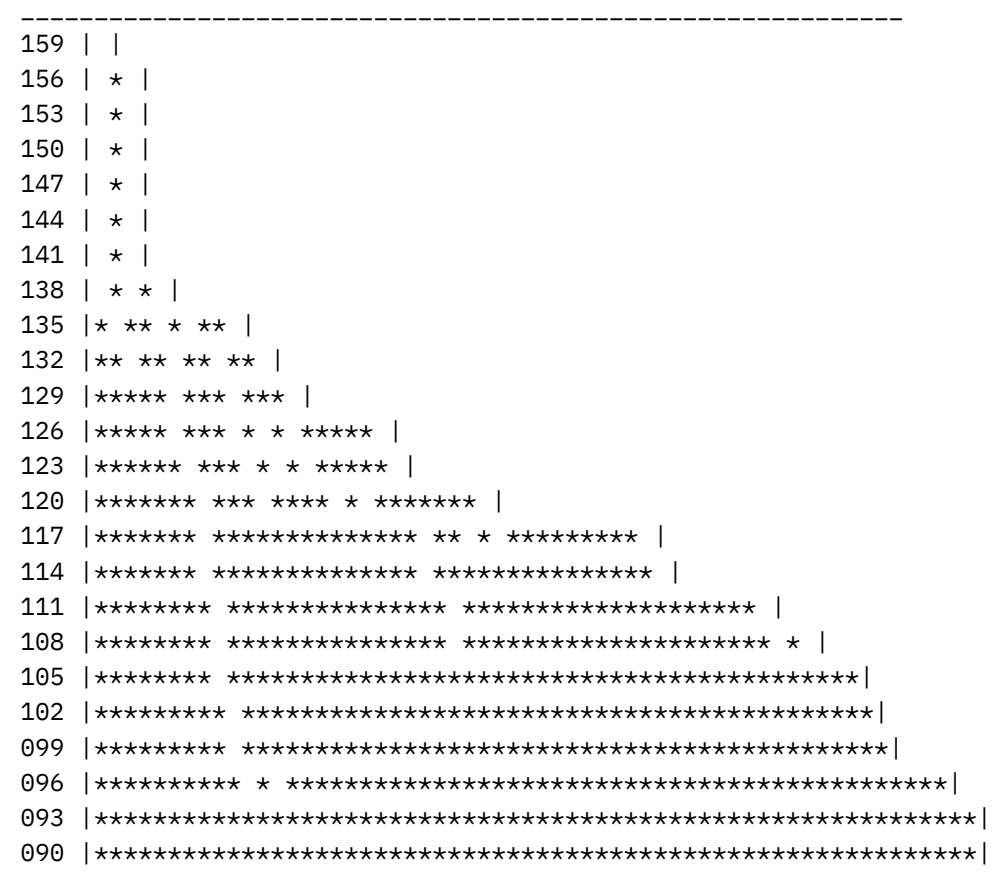
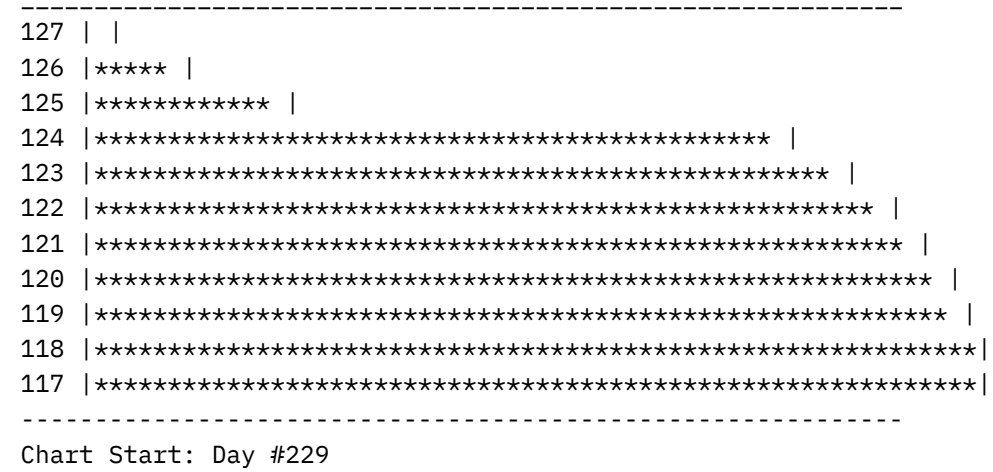
Chart Start Date: Day #230

NOTES:
This graph is determined by plotting the greater of either the planetary A-index or the Boulder A-index. Graph lines are labelled according to the severity of the activity which occurred on each day. The left-hand column represents the associated A-Index for that day.
Q = Quiet, U = Unsettled, A = Active, M = Minor Storm,
J = Major Storm, and S = Severe Storm.

CUMULATIVE GRAPHICAL CHART OF THE 10.7 CM SOLAR RADIO FLUX



GRAPHICAL ANALYSIS OF 90-DAY AVERAGE SOLAR FLUX



NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day

mean of the 10.7 cm solar radio flux.

CUMULATIVE GRAPHICAL CHART OF SUNSPOT NUMBERS

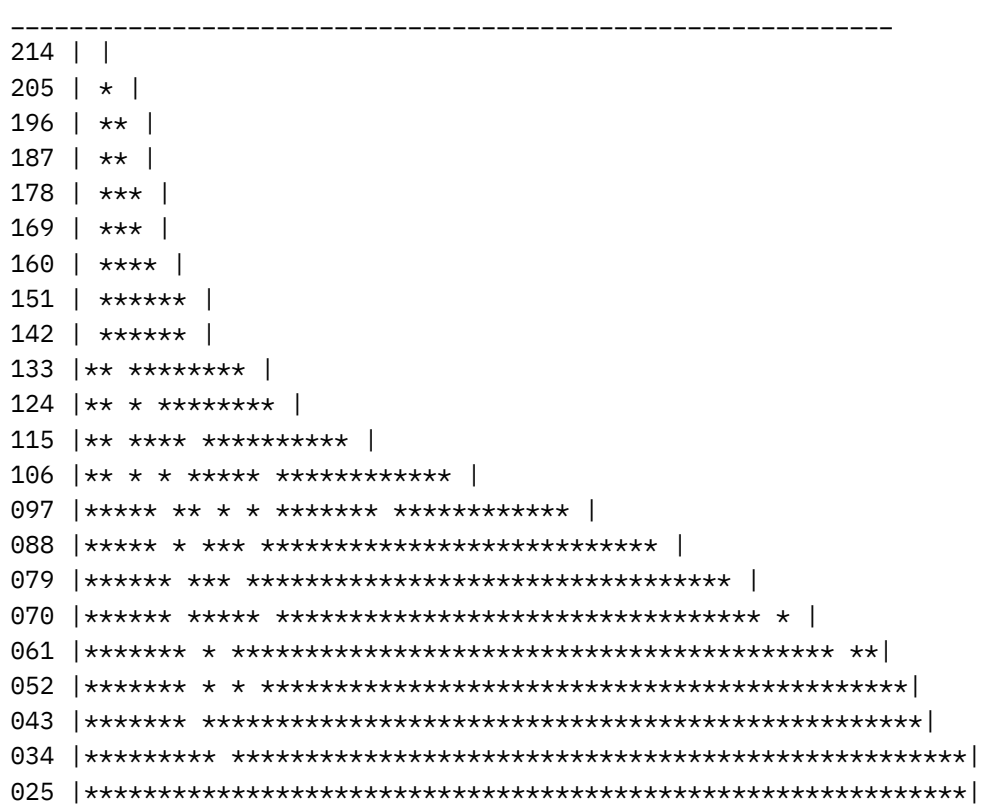


Chart Start: Day #229

NOTES:
The graphical chart of sunspot numbers is created from the
daily sunspot number counts as reported by the SESC.

NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "Oler@Rho.Uleth.Ca" or "COler@Solar.Stanford.Edu". This document, as well as others and related data and forecasts exist on the STD BBS at: (403) 756-3008.

I agree completely. I'm supprised there wasn't a suggestion to start up
a group called rec.radio.amateur.subjects.I.don't.like .

3843. More Truth about UHF connectors

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-15 21:03:13 UTC
From: frankb@hpsad.sad.hp.com
Message-ID: <27890031@hpsad.sad.hp.com>
Source record: 284146

Nobody has put down UHF connectors for a few days, so I thought
it was about time to start up the discussion again.

The equation for the impedence of a coaxial transmission line is:

Z=(60/A)*loge (b/d)

where A = square root of the relative dielectric constant
b = inside diameter of the shield or ground
d = outside diameter of the center conductor
loge = log to the base e (2.71828...)

This is from "Microwave Filters, Impedence-Matching Networks,
and Coupling Structures" by G. Mattai, L. Young, & E.M.T. Jones,
Copyright 1980, page 165

The relative dielectric constant for teflon is 2.1
(relative to air of course). The dielectric constant for phenolic
is highly variable, but tends to be around 3.5. At high frequencies
it is so lossy that the dielectric constant is irrelevant.

I grabbed a handful of connectors and started measuring. The
connectors I had all had teflon dielectric, but I also calculated
what the impedence would be if they were phenolic.

dimensions are in inches. Dimensions for some of the connectors are
approximate - I didn't want to destroy the connectors to get better
accuracy.

teflon: phenolic:
SO-239 barrel: b=.35 d=.21 Z = 21 ohms Z = 16 ohms no brand name
SO-239 bulkhead: b=.47 d=.21 Z = 33 ohms Z = 26 ohms no brand name
PL-259/RG-8: b=.464 d=.218 Z = 31 ohms Z = 24 ohms silver plated
PL-259/BNC adapter: b=.48 d=.16 Z = 45 ohms made by Amphenol

BNC: b = .26 d = .08 Z = 49 ohms made by Amphenol
N: b = .2745 d = .119 Z = 50 ohms (air dielectric) made by HP
sma: b = .160 d = .0485 Z = 49 ohms made by Amphenol

The "UHF" connectors aren't even close to 50 ohms, except for the one made
by Amphenol. Even the silver plated connector, which is often assumed to
be a sign of quality, is pretty poor. It would be interesting to compare
some other styles of UHF connectors made by Amphenol to see how they compared.

>reads? Neither of the pagers has any reeds in them, which socket is for
>the common reed?

Write to or call Midian Electronics and ask for their tone wall chart. It'll give you timings and frequencies for the Quick Call 2 tones the Minitor uses. I believe the center reed is the common; the reeds are all identical, so you can swap them around as you wish. The numbers on the pager don't correspond to reed tones.

Midian is 1-800-MIDIANS, according to the chart. They don't actually sell the reeds, just manual encoders and decoders for all sorts of encoding.

>on weekends and late at night, when we don't have a dispatcher. Does
>anyone know of an encoder that interfaces with the phone system and costs
>less than $1000? Being that we're self-funded, it's hard to come up
>with that kind of money to support 2 pagers (no matter how important

Interfacing with the phone system is a hard one. Otherwise, you can use a PC to generate the tones. You might want to think about falling back to numeric pagers and a local contract, which might be cheaper than all this.

3847. Help?: Weak Alinco DJ-F1

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-15 22:06:22 UTC
From: IADLRA@ASUACAD.BITNET
Message-ID: <92289.150623IADLRA@ASUACAD.BITNET>
Source record: 284269

Any ideas or suggestions?...
My Alinco DJ-F1 HT used to work OK. Recently it has compared poorly
with adjacent other-brand HT's in both reception and transmission.
We have tried new and recharged batteries. Swapping antennae did
not change it.

Before I send it in for diagnosis and repair,...any ideas?

Thanks much.

Well, in this case you are wrong. I can't recall the fellow's name and call,
but his first name is Bill, and he has an 8-land call, and is an AMATUER EXTRA
class operator.

Before you dismiss the proposal out of hand, why don't you read it first?
I've skimmed through it, and I must say he had some interesting points.

Personally, I don't support the proposal as written, but I do think there's
a couple of valid points: 1) we have far too many license classes, and
2) too much is tied to CW proficiency, not enough to electronic theory
and operating procedures.

> This proposer must figure that the extra class guys got their licenses thru
> cheating or bribes, certainly not by working at it.

Well, he got his Extra legitimately, so I doubt he thinks that.

Of course, regardless of the intent of the proposer, we should consider
the proposal on its merits, regardless of the source.

> If this becomes law, the bell has tolled, the end of Ham radio as we know it.

I bet you said the same thing about the codeless Tech class. Hasn't happened.

Why is it that ever little change in licensing structure immediately spells
the death of the hobby?

Change is part of life. Get used to it.

> The ham bands will be nothing more than glorified CB radio!

Yeah, yeah, just like the codeless tech class, uh huh.

> If this rulemaking proposal passes, they'll be alot of ham equipment going up
> for sale, and a lot of guys turning their licenses.

If there are hams that are this petty, then the hobby is much better off without them.

```
****************
* ANNOUNCEMENT *
****************

This message is to announce the resurrection of North
America's oldest university amateur radio club, namely

ARCMU Amateur Radio Club of McGill University
Call VE2UN

located in Montreal, Quebec, Canada!
Yes, we're very proud to announce that we're back!

In support, MARC (Montreal Amateur Radio Club) has joined
forces with ARCMU in putting up a 2m repeater.

The repeater is the original VE2BG station and is now
located on top of Burnside Hall at the corner of University
and Sherbrooke streets. It has an effective output of 25
Watts.

All previous members as well as all amateurs are welcome
to join! Previous members are encouraged to make yourself
known as we're trying to re-establish lost contacts.

If you have ANY questions, feel free to mail me at

silver@ee470.ee.mcgill.ca or
lmcansi@noah.ericsson.se

Thanx, and 73's!

Quicksilver! VE2HHS
```

3851. Re: kerchunking repeaters

Actually, kerchunking is the one behaviour that absolutely sets the professionals apart from the amateurs - the professionals KNOW that their radio is going to work, that the repeater is going to work, and that they can simply pick up the microphone and make a call.

It's the amateur whose equipment has proven so unreliable that it has to be tested every time it needs to be used.

Which are you?

Ahem.

I just got my new DJ-F1T an hour ago. Now, what do I have to do to get the the thing to receive AM Aircraft. This may be a FAQ, but I can't seemed to find any info on the net.(i.e. I have no luck with that server at UWA.CA so far.)

Will a kind soul please post the mods for this radio to the net?

Thanks in advance.

J.T.

Naw. Don't bother trying to keep it from drifting; go get a defunct Swan and put the nameplate on the one you're building. A nameplate from an Eico 753 will do as well.

I experimented with using my w2a as a packet radio by connecting it to
a Baycom tnc interfaced to my 386. The w2a would not even start
transmitting with a 3300 ohm resister leak. Things worked better when
I added a second 3300 ohm resister in parallel with the first.

I'm for that.

CW is just another facet of Amateur Radio. Today, with the plethora of
options that an amateur operator has to explore, why have only one means
by which people can move up to the top rung on the ladder?

|> simple (and annoying) problem...

Well, I'm pretty sure this is not exactly what you had in mind, but I think
it may give a resuly you could use...

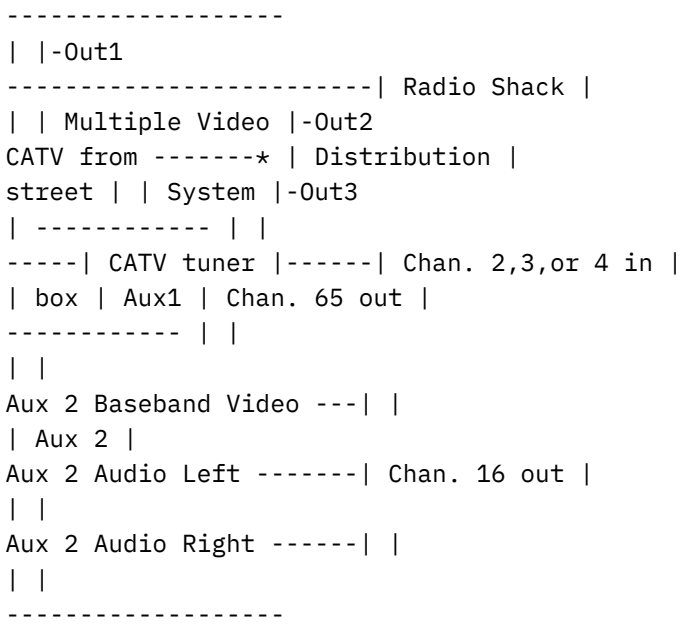
Radio Shlock makes a unit they call a Multiple Video Distribution System,
catalog number 15-1290. It takes the channel 2,3, or 4 signal and converts
it to UHF (NOT CABLE) channel 65, tuneable plus or minus about 3 UHF channels.
This unit also will take a baseband video signal (simultaneously) and "modulate
it" to channel 14-18 (UHF again). I have one of these units, and the quality
of the modulator is as good as I've seen for less than $2000. Certainly
beats whatever my local cable company is using! I can't vouch for the Channel
3 conversion, since I don't really use it, but when I was checking it out,
it looked fine.

The problem in your application is that most TV's don't make it easy to switch
from Cable frequencies to Broadcast frequencies... If you have an XBR Sony or
some other TV with two RF inputs, and you can set one to Cable and the other to
Broadcast, that might work... I have two cables (at least) running around
my house--one is the Cable Companies, and the other is from my antenna. It
makes me crazy (sometimes) to see the lousy signal of the local stations on
Cable caused by Jones' shitty equipment... Especially when my $50 antenna
is putting out a perfect picture.

Hey, I bet those UHF freqs trnslate to Cable channels... Let's see....
Yes! Ok, maybe this would work for you! UHF 14-18 correspond to Cable
65-69, and UHF 63-68 correspond to Cable 119-124. No problem, at least
as long as your cable company doesn't use all of those channels. There is
some bandpass filtering in the RS unit, because the instructions tell you to
try to leave "at least one unused channel between the AUX 1 output channel
and any UHF broadcast channel."

I'd give it a try--RS will take it back if it doesn't work for you, or so
they claim. The tuning is analog, and a bit tricky with some digital AFC TV's.
Seems pretty stable, though.

Here's what your setup would look like:



| |-Out1
| Radio Shack |
| | Multiple Video |-Out2
CATV from -------* | Distribution |
street | | System |-Out3
| ------------ | |
-----| CATV tuner |------| Chan. 2,3,or 4 in |
| box | Aux1 | Chan. 65 out |
------------ | |
| |
Aux 2 Baseband Video ---| |
| Aux 2 |
Aux 2 Audio Left -------| Chan. 16 out |
| |
Aux 2 Audio Right ------| |
| |

The modulator doesn't appear to be stereo, BTW. They claim each of the outputs can drive a two way splitter, so the thing is a Distribution Amp, too. All for $60, not bad.

Good luck!

Well, after much input from many people on the net, and in my area, myself and a number of my amateur friends have made the committment to construct a repeater (Both financially, and in our minds). It has come down to this point where I must once again call on the wisdom of the net.

We have ammassed the major points of the repeater: the equipment, the site, etc. . I have but one question:

How/who do we go about contacting to have a frequency allocated to us in the area? I realize that there are committees and such that coordinate these systems, but we are at a loss to find there location..

Could someone help?

Source record: 284135

I think the license restructuring proposal has merit, but I believe there is a better alternative, based on the way things *used* to be, many moons ago. Herewith is what I'd like to see proposed:

1. Merge Novice, Tech+, General, and Advanced into a single HF license class, 5 wpm morse requirement, technical test level equivalent to the current advanced class. HF band privliges equivalent to current advanced class. Program to be phased in so that the lower classes have to take the additional theory tests before the old system expiration date, so everyone starts equal under the new system. You don't test for the additional theory, you loose.

2. Keep the Extra class as it is now. It has always been a badge of honour and prestige, and should be left as such. The 20 wpm morse requirement for Extra has been in place since at least 1927, and if one is that hellbent on getting on those small slivers of bandwidth reserved for Extras, they probably already have an Extra, or will be willing to pay the tithe for one. In any event, it should be kept as it was intended, a mark of prestige.

3. The no-code Tech should be the *only* entry level license. The argument about keeping the novice class as an alternate entry point for kids is something of a moot point. If one can handle the theory for Novice, they are equally capable of handling the Tech theory.

So there it is. When the proposal gets an RM number and is opened up for comments, I would hope that something along these lines is offered as an amendment or counter proposal. I think this strategy benefits the most without some of the strongest objections -- namely the elimination of the Extra, and gaining additional benefits without working for them. What do you think?

This sounds suspiciously like a problem I had with my 430 on voice. It
would behave quite similarly, losing power and becoming distorted on an
occasional basis. There was a well reported problem with early 430's
where the finals were riveted, but not soldered, and the rivets could
eventually develop a high electical resistance, with ensuing power problems.
This was diagnosed and corrected by Kenwood early, so I doubt it would be a
problem in a unit manufactured as late as yours. (I bought mine in late
1984, and it already had a modified PA -- believe me, I checked!)

My problem turned out to be a marginal connection in the internal switch
on the XVTR jack on the back of the rig. This is the connector with 8 pins.
The switch is integral to the connector and works when the plug is inserted.
The fix was to insert and remove the plug in the jack several times. Since
I have done this, my 430 has never shown this symptom again.

I wish I could claim to have deduced this myself, but it was pointed out to
me by a friend who read it in a snippet from someone in QST. To whoever
took the time to send in that suggestion, I am eternally grateful. Hope
this solves your problem, too.

I just got my new DJ580 back from AES my first one would stay on frequency.
They were very prompt and curtious in replacing it. I am a very satisfied
coustomer. I bought the DJ580 at the Wichita ham fest. I also got a ride
on their Beech Starship. I cut the red & blue wires and it recives aircraft and
up to 900 mgHz. It seems to work ok.

SB DX ARL ARLD052
ARLD052 DX news

Thanks to Tedd, KB8NW, WAYNE, KH6WZ, DICK, AA5NT, and the Ohio/Penn DX PacketCluster Network for the following DX information.

ETHIOPIA. ET3BC and ET3YL have been heard on 21295, 14200, 14245 and 7011 kHz. QSL ET3BC via K4PHE, and ET3YL via N4NX.

MINAMI TORISHIMA. JA9IPX/JD1 and JK1ABP/JD1 will be active until January 14, 1993, on all bands with SSB, CW and PACKET.

FAROE ISLANDS. OY2VO has been active on 28420 kHz around 1354 and on 21349 kHz around 1700z. QSL via OZ9DP or the bureau. OY1HJ has been active on 14226 kHz around 2155z.

BANGLADESH. JO3XEQ, JO3XER and JH7DHS will be active as S21U until October 18. Activity is on 160 thru 6 meters with SSB, CW and RTTY. Suggested frequencies are 1824, 1910, 3511, 3799, 28495 and 29260 kHz.

BURKINA FASO. XT2BW is now up and running on RTTY. He can be found on 28073 kHz around 2156z. QSL via WB2YQH.

SAN FELIX. John, XQ0X is QRV again from San Ambrosio Island for a four month stay. QSL via CE3ESS.

EASTERN MALAYSIA TRIP CANCELED. Yutaka, JA9AG, was on his way to the airport for his 9M6 DXpedition when he was involved in a traffic accident. His injuries were not severe.

LACCADIVES. A group led by Vidi, VU2DVP, will be active from around 2000z on October 17 until the 24th. They are going to operate mostly satellites, but may do some HF work on 20 meters.

BAHAMAS. W5ZPA, W5LN and K5KR will be QRV from C6A between October 19 and 23.

Another group comprised of WB2LMA as C6AHG, N5OON as C6AHH, N5TVL as C6AHM, and AA5NT as C6AFT, will be active from Treasure Cay on Great Abaco Island from October 22 through 29. Look for the C6AFT multi-single effort in the CQWW Contest October 23, 24 and 25. QSL their home calls.

SAINT LUCIA. Jon, KB6ZBI, Bob, K0IYF, Mike, NI7T, and Wayne, KH6WZ, plan a serious effort for the CQWW DX SSB Contest. NI7T plans to operate satellites before and after the contest. Some 6 meter activity is possible. Look for this group between October 20 and 28.

GRENADA. Four OPS from 8 land will be active from October 21 thru the 27, including a multi-single effort for the CQ WW DX SSB Cnntest signing J37L. Outside contest hours they will be active on all bands with CW and SSB. Look for J3/WD8MQJ, J37C, J37E, and J37L. QSL via the W8-QSL bureau.

VANUATU. Goran, SM4DHF, and Jan, SM5LNE, will sign YJ0C and YJ0B respectively, between October 21 annd31. YJ0C is the multi-single call to be used for the CQWW Contest. They will be active on CW and RTTY before and after rhe contest. RTTY QRG ARE 14083 AND 21083 kHz. QSL via SM4DHF.

MADAGASCAR. Hideki, JH8JWF, will be active from October 22 through 27 on all bands with CW, SSB and RTTY. Look for him during the CQ WW DX SSB Contest with a 14 MHz SSB singlr band effort.

GUADELOUPE. Jim, W6JKV, expeXts to sign FG/W6JKV from about October 23 to November 9. Activity will be on 6 meter SSB and CW, and on 2 meter EME with a monster 54 foot long yagi. For the latest information on this operation and other 6 meter activity, listen in on 28885 kHz.

CROATIA. Erik, ON5AI, will be QRV as 9A/ON5AI begining on October 24 and staying until May 1993. Erik belongs to the Belgian UN ''Blue Helmet'' forces controlling the peace in 9A land. He will be active on all bands with CW and SSB. A Special QSL will be available via Box 45, Kasterlee 2460 Belgium.

COCOS ISLAND. Jose, TI2JJP, says everything is on schedule for TI9JJP to start on November 1 and end on 11th. This DXpedition will operate SSB and RTTY only. Check 10, 15 and 20 meters. Some activity is possible on 75 meters. QSL via TI2AOC.

BELIZE. Glenn, AE0Q will activate V31RY from November 22 through 31. QSL via WN0B.

RTTY SPOTS.

Goodbye. Good riddence. They will NOT be missed. The hobby can only
be improved by this change.

I fully intend to file comments with the FCC supporting this change.
(Those who read my comments to them on the no-code proposal a few years
ago will note that I suggested an essentially similar plan then.
I still think it's a good idea.)

I doubt it. More likely, it would have resulted in a anarchistic
response, such as you being mailbombed.

BTW, setting the Newsgroups: line to "MAIL ONLY" doesn't do much except
annoy people. Perhaps you ought to figure out how to actually _use_
Usenet properly before thinking about changing Usenet policy.

Ciaran.

>: them: with a majority vote I probably could have gotten away with it, and
>: it would have changed Usenet policy. We still need some kind of
>: self-regulation system that lies between moderated groups and total
>: anarchy.

I don't think so. Usenet is a /functional/ anarchy. Emphasis on
functional, i.e. /it works/. If it ain't broke don't fix it... and
while it doesn't work perfectly, I think if you look at the general
perception of how well it does/doesn't work, you might find that a
greater percentage of people are happy with the way Usenet runs than
are currently happy with the the American (USA) democratic system of
Government.

But if you think that you can come up with a better system, all the
more power to you... Usenet isn't the only system that uses the Netnews
transport mechanism, and just as some thought even Usenet to be too
restrictive and created Altnet, you can always start "Democratic-net"
or "Dictatorship-of-the-masses-net" or "Bruce-is-king-net". If you
really feel that more authority, of whatever form, is needed, that is
the /only/ way to accomplish it. You will never succeed in imposing
any kind of additional restrictions on the existing Usenet.

3876. CC&Rs and radio antennas

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-16 12:15:50 UTC
From: dale@sequent.com
Message-ID: <1992Oct16.121550.24940@sequent.com>
Source record: 284166

I have recently put up 50 feet of Rohn 25 tower and a Cushcraft tri-bander (A3S) with the 40 meter dipole addition to the driven element. The good news is that this really adds a new dimension to amateur radio when compared to the previous antenna -- the Cushcraft R7 with base 17 feet off the ground.

You can guess the bad news -- some of the neighbors are not happy about this. At the board meeting last night I found that a two page letter had been given to the president of the homeowners association complaining about the antenna. The letter states that there are at least 6 homeowners that are upset with this. The two issues seem to be concerns with interference (RFI) and devaluation of property values as well as the looks of the antenna and tower.

I can deal with RFI issues, having the ARRL information as well as many other RFI resources. The homeowners board understands that the RFI issue is not a concern of theirs and does not affect the decision on whether the antenna is allowed.

The question is really one of deciding if the 50 feet of Rhon 25 and beam is "just another antenna". The CC&Rs state that "no building, fence, wall or other structure shall be erected or maintained..., nor shall any exterior addition to or change or alteration be made..., without board approval".

The area does allow outside antennas for television and the CC&Rs do not make any statements specifically talking about antennas. So my first question is how do I best support my position that this is not a structure, just another antenna and must be treated the same as all other antennas now in use?

The second question is what evidence can I use to demonstrate that this does not lower the property values? The letter states that this person has "spoken to a Realtor about devaluation of homes and they say that such a structure will pull down values of those homes surrounding the property and cause the homes to sell more slowly".

How do I go about finding a Realtor that will state that this has no significant effect on the values of surrounding homes? Does anyone know of any court cases where this was an issue and it was decided that the antenna did not lower property values?

Thanks for any help. 73, Dale.

[stuff about how auto-cancelling offensive articles is 'censorship']
>Mike, N4PDY

Mike (and all others)...

Censorship is when one person forbids another to express certain opinions.
Filtering net-traffic doesn't forbid them any expression, rather it simply
selects which material the station-owner is willing to foot the bill for!
^^^^^^^^^^^^^
Freedom of Speach does *not* apply to the filtering of amateur net-traffic,
since no one's *RIGHTS* are being infringed upon... You can still *say*
whatever you like (on your own time, with your own transmitter, paying for
it out of your own wallet). The re-transmission of net-traffic however,
payed for by private citizens, is a *PRIVELIDGE* granted at the discretion
of the one(s) bearing the *cost* of it.

IT IS * N E V E R * YOUR "RIGHT" TO SPEND *OTHER* PEOPLE'S MONEY!!!

It has been justly observed that ignorance is preferable to error.N.Webster

[...]
>The likelyhood that I'll ever agree with John is vanishingly small, but
>he is entitled to his say here, as are we all.

Alan makes a *serious* (though common) mistake here...

NO *ONE* is "entitled" to have a say on the UseNet. It's *not* a 'right',
it's a *privelidge* granted to each user on an individual basis by whoever
owns the machine by which that user accesses 'the net'.

SOME sites (governmentally funded) have a responsibility to provide equal
service to all of their users. Still, those sites have every right to be
equally restrictive if they so desire. There are a lot of politics along
with theses special sites, but it still comes down to the same thing...

You don't have any 'right' to anything you haven't personally payed for.
Anything beyond that is strictly 'privelidge'.

It has been justly observed that ignorance is preferable to error.N.Webster

I like it. The only thing between me and a general for the past 30+
years has been the code. It makes no sense to me to require 13wpm
as a code requirement to gain access to the HF voice/packet and
other non-cw modes given that I passed the general written test 30
years ago.

In another post I've already indicated my support, but I wouldn't be
opposed to keeping the higher level licenses with the privaledges
they now have. BUT, I'll again state that as a 30+ year technician,
I see no reason to exclude me from the non-CW modes of the HF
bands that are open to Generals simply because I don't have 13wpm
CW speed. I have already demonstarted full technical competence
as a General when I took my obtained my Tech license 30 years ago.

(Additional predictions by Mr. Ordon of the immiment demise of Ham Radio
deleted.)

3884. logging program & cards

Newsgroup: rec.radio.amateur.misc
Date: 1992-10-16 13:15:15 UTC
From: taylor@tix.timeplex.COM
Message-ID: <9210161315.AA01202@tix.timeplex.com>
Source record: 284177

Can anyone recommend a good ms/dos logging and QSL program ? I'd like to get one based on dBASE , but I haven't found one yet short of writing my own. I'm interested in tracking DXCC contacts and printing QSL cards too. I don't need this for contesting. Price is not a factor, so a commercial product (it can be shareware) is ok. Any recommendations ? Also, I've been looking for pin fed pre-printed QSL cards. I've receieved a few from some DX stations (HB9 land), but I've never seen any ads in the US for a similar product. I contacted a few commercial printing places and the prices per 1000 were ok except the minimum was a run of 10,000 ! Any suggestions ?
